## Abstract

20 Dengue fever remains a significant public health concern in the Philippines, with  
21 cases rising dramatically in recent years. Nationwide outbreaks have placed im-  
22 mense strain on healthcare systems, underscoring the need for innovative ap-  
23 proaches to surveillance and response. In Iloilo City, this national trend was  
24 reflected in a significant surge, with the Iloilo Provincial Health Office reporting  
25 4,585 cases and 10 fatalities as of August 10, 2023—a 319% increase from the pre-  
26 vious year’s 1,095 cases and one death. This study developed a centralized system  
27 for monitoring and modernizing data management of dengue cases in public health  
28 institutions, making it more efficient and acceptable. Using data gathered from  
29 the Iloilo Provincial Health Office and online sources, several deep learning mod-  
30 els were trained to predict dengue cases, utilizing weather variables and historical  
31 case data as inputs. These models included Long Short-Term Memory (LSTM),  
32 ARIMA, Seasonal ARIMA, Kalman Filter (KF), and a hybrid KF-LSTM model.  
33 The models underwent time series cross-validation strategies to mimic real-world  
34 conditions as closely as possible and were evaluated using metrics such as Mean  
35 Squared Error (MSE), Root Mean Squared Error (RMSE), and Mean Absolute  
36 Error (MAE). The LSTM model demonstrated the best performance with the  
37 lowest RMSE of 16.90, followed by the hybrid KF-LSTM model at 25.56. The  
38 LSTM model was then integrated into the system to provide forecasting features  
39 that could support health institutions by offering actionable insights for proactive  
40 intervention strategies.

# <sup>155</sup> Chapter 1

## <sup>156</sup> Introduction

### <sup>157</sup> 1.1 Overview

<sup>158</sup> From 2020 to 2022, dengue cases declined due to reduced surveillance during the  
<sup>159</sup> COVID-19 pandemic (WHO, 2023), but cases surged in 2023 as restrictions were  
<sup>160</sup> lifted. This year saw an increase in dengue outbreaks worldwide, with over five mil-  
<sup>161</sup> lion cases and more than 5,000 deaths reported in over 80 countries (Bosano, 2023).  
<sup>162</sup> Dengue is endemic in the Philippines, leading to longer and more widespread sea-  
<sup>163</sup> sonal outbreaks. Globally, dengue infections have increased significantly, posing  
<sup>164</sup> a major public health challenge. The World Health Organization reported a ten-  
<sup>165</sup> fold rise in cases between 2000 and 2019, with a peak in 2019 when the disease  
<sup>166</sup> spread across 129 countries (WHO, 2024).

<sup>167</sup> Iloilo City and Province are intensifying efforts to curb the rising dengue cases  
<sup>168</sup> (Lena, 2024). As of August 10, 2023, the Iloilo Provincial Health Office recorded  
<sup>169</sup> 4,585 cases and 10 deaths, a 319% increase from last year's 1,095 cases and one  
<sup>170</sup> death. Governor Arthur Defensor Jr. confirmed that the province has reached the  
<sup>171</sup> dengue outbreak threshold based on Department of Health (DOH). Local govern-  
<sup>172</sup> ment units (LGUs) have been informed, and the province's disaster management  
<sup>173</sup> office is on blue alert, indicating disaster mode. (Perla, 2024)

<sup>174</sup> In Iloilo City, 649 dengue cases were recorded this year 2024, with two deaths.  
<sup>175</sup> Cases cluster in 40 out of 180 barangays, meaning multiple cases are being reported  
<sup>176</sup> in these areas over several weeks. The city's health officer, Dr. Roland Jay  
<sup>177</sup> Fortuna, reported high utilization of non-COVID-19 hospital beds, reaching over  
<sup>178</sup> 76%, prompting concerns about hospital capacity.

<sup>179</sup> This study explores the monitoring and forecasting of dengue outbreaks by analyzing key factors such as temperature, relative humidity, and historical dengue cases, using different models. The findings aim to provide an advanced, AI-driven alternative for dengue prevention and control, targeting agencies like the Department of Health (DOH). By aligning with the national AI Roadmap, particularly in Iloilo City, this research aspires to improve outbreak responses through cutting-edge technology rather than traditional reporting methods.

## <sup>186</sup> 1.2 Problem Statement

<sup>187</sup> Dengue remains a critical public health challenge worldwide, with cases increasing due to the easing of COVID-19 restrictions and heightened global mobility. While <sup>188</sup> a temporary decline in cases was observed during the pandemic (2020–2022) due <sup>189</sup> to reduced surveillance efforts, 2023 marked a resurgence, with over five million <sup>190</sup> cases and more than 5,000 deaths reported across 80 countries. In dengue-endemic <sup>191</sup> regions like the Philippines, the threat is particularly severe. In Iloilo City and <sup>192</sup> Province, dengue cases rose by 319% as of August 2023, overwhelming local health-<sup>193</sup> care systems. This surge strained resources, with over 76% of non-COVID-19 hos-<sup>194</sup> pital beds occupied by dengue patients, highlighting the urgent need for effective <sup>195</sup> predictive tools. The lack of a reliable system to monitor and forecast dengue <sup>196</sup> outbreaks contributes to delayed interventions, exacerbating public health risks <sup>197</sup> and healthcare burdens in the region.

## <sup>199</sup> 1.3 Research Objectives

### <sup>200</sup> 1.3.1 General Objective

<sup>201</sup> This study aims to develop a centralized monitoring and analytics system for <sup>202</sup> dengue cases in Iloilo City and Province with data management and forecasting <sup>203</sup> capabilities. The researchers will train and compare multiple deep learning models <sup>204</sup> to predict dengue case trends based on climate data and historical dengue cases <sup>205</sup> to help public health officials in possible dengue case outbreaks.

### <sup>206</sup> 1.3.2 Specific Objectives

<sup>207</sup> Specifically, this study aims to:

- 208 1. Gather dengue data from the Iloilo Provincial Health Office and climate data  
209 (including temperature, rainfall, wind, and humidity) from online sources.  
210 Combine and aggregate these data into a unified dataset to facilitate com-  
211 prehensive dengue case forecasting.
- 212 2. Evaluate deep learning models for predicting dengue cases using metrics  
213 such as Mean Absolute Error (MAE), Root Mean Squared Error (RMSE),  
214 and Mean Squared Error (MSE). Compare the performance of these models  
215 to determine the most accurate forecasting approach.
- 216 3. Develop a web-based analytics dashboard that integrates a predictive model  
217 and provides data management system for dengue cases in Iloilo City and  
218 the Province.
- 219 4. Assess the usability and effectiveness of the analytics dashboard through  
220 structured feedback and surveys involving health professionals and policy-  
221 makers.

222 **1.4 Scope and Limitations of the Research**

223 This study aims to gather dengue data from the Iloilo Provincial Health Office  
224 and climate data from online sources such as PAGASA or weatherandclimate.com.  
225 These data will be preprocessed, cleaned, and combined into a unified dataset to  
226 facilitate comprehensive dengue case forecasting. However, the study is limited by  
227 the availability and completeness of historical data. Inconsistent or missing data  
228 points may introduce biases and reduce the quality of predictions. Furthermore,  
229 the granularity of the data will be in a weekly format.

230 To evaluate deep learning models for predicting dengue cases, the study will  
231 train and compare the performance of various models, using metrics like Mean  
232 Absolute Error (MAE) and Root Mean Square Error (RMSE). While these models  
233 aim to provide accurate forecasts, their performance is heavily influenced by the  
234 quality and size of the dataset. Limited or low-quality data may lead to suboptimal  
235 predictions. Additionally, the models cannot fully account for external factors  
236 such as public health interventions or socio-economic conditions which may impact  
237 dengue transmission dynamics.

238 The study also involves developing a web-based analytics dashboard that in-  
239 tegrates predictive models and provides a data management system for dengue  
240 cases in Iloilo City and the Province. This dashboard will offer public health  
241 officials an interactive interface to visualize dengue trends, input new data, and

<sup>242</sup> identify risk areas. However, its usability depends on feedback from stakeholders,  
<sup>243</sup> which may vary based on their familiarity with analytics tools. Moreover, exter-  
<sup>244</sup> nal factors such as limited internet connectivity or device availability in remote  
<sup>245</sup> areas may affect the system's adoption and effectiveness. While the dashboard  
<sup>246</sup> provides valuable insights, it cannot incorporate all factors influencing dengue  
<sup>247</sup> transmission, emphasizing the need for ongoing validation and refinement.

## <sup>248</sup> 1.5 Significance of the Research

<sup>249</sup> This study's development of an AI-based dengue forecasting and monitoring sys-  
<sup>250</sup> tem has wide-reaching significance for various stakeholders in Iloilo City:

- <sup>251</sup> • Public Health Agencies: Organizations like the Department of Health (DOH)  
<sup>252</sup> and local health units in Iloilo City and Province stand to benefit greatly  
<sup>253</sup> from the system. With dengue predictions, we can help these agencies opti-  
<sup>254</sup> mize their response strategies and implement targeted prevention measures  
<sup>255</sup> in high-risk areas before cases escalate.
- <sup>256</sup> • Local Government Units (LGUs): LGUs can use the system to support  
<sup>257</sup> their disaster management and health initiatives by proactively addressing  
<sup>258</sup> dengue outbreaks. The predictive insights allow for more efficient planning  
<sup>259</sup> and resource deployment in barangays and communities most vulnerable to  
<sup>260</sup> outbreaks, improving overall public health outcomes.
- <sup>261</sup> • Healthcare Facilities: Hospitals and clinics, which currently face high bed  
<sup>262</sup> occupancy rates during dengue season will benefit from early outbreak fore-  
<sup>263</sup> casts that can help in managing patient inflow and ensuring adequate hos-  
<sup>264</sup> pital capacity.
- <sup>265</sup> • Researchers and Policymakers: This AI-driven approach contributes valua-  
<sup>266</sup> ble insights for researchers studying infectious disease patterns and policy-  
<sup>267</sup> makers focused on strengthening the national AI Roadmap. The system's  
<sup>268</sup> data can support broader initiatives for sustainable health infrastructure  
<sup>269</sup> and inform policy decisions on resource allocation for dengue control.
- <sup>270</sup> • Community Members: By reducing the frequency and severity of outbreaks,  
<sup>271</sup> this study ultimately benefits the community at large. This allows for timely

<sup>272</sup> awareness campaigns and community engagement initiatives, empowering  
<sup>273</sup> residents with knowledge and preventative measures to protect themselves  
<sup>274</sup> and reduce the spread of dengue.

<sup>275</sup> **Chapter 2**

<sup>276</sup> **Review of Related Literature**

<sup>277</sup> **2.1 Dengue**

<sup>278</sup> Dengue disease is a tropical and subtropical mosquito-borne viral illness and is a  
<sup>279</sup> major health concern in the Philippines (Bravo, Roque, Brett, Dizon, & L'Azou,  
<sup>280</sup> 2014). The majority of individuals with dengue experience no symptoms. Fever is  
<sup>281</sup> the most common symptom, typically 4 to 7 days after being bitten by an infected  
<sup>282</sup> mosquito (Zhou & Malani, 2024). In recent years, the trend of dengue cases in  
<sup>283</sup> the Philippines has shown notable fluctuations, with periodic outbreaks occur-  
<sup>284</sup> ring every 3 to 5 years, often influenced by climatic and environmental changes.  
<sup>285</sup> According to the Department of Health (DOH), the number of reported cases  
<sup>286</sup> has steadily increased over the past decades, attributed to urbanization, popula-  
<sup>287</sup> tion growth, and inadequate vector control measures (World Health Organization  
<sup>288</sup> (WHO), 2018). Moreover, studies suggest that El Niño and La Niña events have  
<sup>289</sup> significant effects on dengue incidence, with warmer temperatures and increased  
<sup>290</sup> rainfall providing favorable breeding conditions for mosquitoes (Watts, Burke,  
<sup>291</sup> Harrison, Whitmire, & Nisalak, 2020). The study of Carvajal et. al. highlights  
<sup>292</sup> the temporal pattern of dengue cases in Metropolitan Manila and emphasizes the  
<sup>293</sup> significance of relative humidity as a key meteorological factor, alongside rainfall  
<sup>294</sup> and temperature, in influencing this pattern (Carvajal et al., 2018).

<sup>295</sup> **2.2 Outbreak Definition**

<sup>296</sup> The definition of an outbreak is a critical factor in disease surveillance, as it  
<sup>297</sup> determines the threshold at which an unusual increase in cases is considered a

298 public health concern. Studies suggest that outbreak thresholds should be context-  
299 specific, given the variability in transmission dynamics across different locations  
300 (Runge-Ranzinger et al., 2016). Outbreak definitions defined using the Endemic  
301 Channel often base thresholds on 2 standard deviations (SD) above the mean  
302 number of historic dengue cases. Other studies (Hemisphere, 2015) also used an  
303 alert threshold of a 5-year mean plus 2 standard deviations. A study by (Brady,  
304 Smith, Scott, & Hay, 2015) discussed that definitions of dengue outbreaks differ  
305 significantly across regions and time, making them inconsistent and incomparable.

306 From the studies above, this research implements an outbreak definition basing  
307 the threshold on 2 standard deviations (SD) above the mean number of historic  
308 dengue cases. It is important to note that for future outbreak definitions, addi-  
309 tional local context like available hospital space etc., must be taken into account  
310 for a more effective outbreak definition.

### 311 **2.3 Existing System: RabDash DC**

312 RabDash, developed by the University of the Philippines Mindanao, is a web-  
313 based dashboard for rabies data analytics. It combines predictive modeling with  
314 genomic data, enabling local health authorities to optimize interventions and al-  
315 locate resources more effectively. RabDash's modules include trend visualization,  
316 geographic hotspot mapping, and predictive forecasting, utilizing Long Short-  
317 Term Memory (LSTM) models for time-series forecasting (RabDashDC, 2024).

318 For DengueWatch, RabDash serves as a strong inspiration, particularly in  
319 its monitoring, historical trend visualization, and forecasting capabilities. These  
320 features align well with the needs of dengue control efforts, providing real-time  
321 insights into outbreak trends and enabling more effective, data-driven decision-  
322 making. RabDash's architecture is relevant to the DengueDash, as dengue out-  
323 breaks similarly require time-series forecasting models. By using LSTM, RabDash  
324 effectively models trends in outbreak data, which provides a framework for adapt-  
325 ing LSTM to dengue forecasting. Research indicates that LSTM models outper-  
326 form traditional methods, such as ARIMA and MLP, in handling the complexities  
327 of time-dependent epidemiological data (Ligue & Ligue, 2022).

## 328 2.4 Deep Learning

329 The study of (Ligue & Ligue, 2022) highlights how data-driven models can help  
330 predict dengue outbreaks. The authors compared traditional statistical meth-  
331 ods, such as non-seasonal and seasonal autoregressive integrated moving average  
332 (ARIMA), and traditional feed-forward network approach using a multilayer per-  
333 ceptron (MLP) model with a deep learning approach using the long short-term  
334 memory (LSTM) architecture in their prediction model. They found that the  
335 LSTM model performs better in terms of accuracy. The LSTM model achieved a  
336 much lower root mean square error (RMSE) compared to both MLP and ARIMA  
337 models, proving its ability to capture complex patterns in time-series data (Ligue  
338 & Ligue, 2022). This superior performance is attributed to LSTM's capacity  
339 to capture complex, time-dependent relationships within the data, such as those  
340 between temperature, rainfall, humidity, and mosquito populations, all of which  
341 contribute to dengue incidence (Ligue & Ligue, 2022).

## 342 2.5 Kalman Filter

343 The Kalman Filter is another powerful tool for time-series forecasting that can be  
344 integrated into our analysis. It provides a recursive solution to estimating the state  
345 of a linear dynamic system from a series of noisy measurements. Its application  
346 in epidemiological modeling can enhance prediction accuracy by accounting for  
347 uncertainties in the data(Li et al., 2022). Studies have shown that Kalman filters  
348 are effective in predicting infectious disease outbreaks by refining estimates based  
349 on observed data. A study published in Frontiers in Physics utilized the Kalman  
350 filter to predict COVID-19 deaths in Ceará, Brazil. They found that the Kalman  
351 filter effectively tracked the progression of deaths and cases, providing critical in-  
352 sights for public health decision-making (Ahmadini et al., 2021). Another research  
353 article in PLOS ONE focused on tracking the effective reproduction number ( $R_t$ )  
354 of COVID-19 using a Kalman filter. This method estimated the growth rate of  
355 new infections from noisy data, demonstrating that the Kalman filter could main-  
356 tain accurate estimates even when case reporting was inconsistent(Arroyo-Marioli,  
357 Bullano, Kucinskas, & Rondón-Moreno, 2021).

358 Our study will compare ARIMA, seasonal ARIMA, Kalman Filter, and LSTM  
359 models using our own collected dengue case data along with weather data to  
360 identify the most effective model for real-time forecasting.

## 361 2.6 Weather Data

362 The relationship between weather patterns and mosquito-borne diseases is inher-  
363 ently nonlinear, meaning that fluctuations in disease cases do not respond propor-  
364 tionally to changes in climate variables(Colón-González, Fezzi, Lake, & Hunter,  
365 2013) Weather data, such as minimum temperature and accumulated rainfall, are  
366 strongly linked to dengue case fluctuations, with effects observed after several  
367 weeks due to mosquito breeding and virus incubation cycles. Integrating these  
368 lagged weather effects into predictive models can improve early warning systems  
369 for dengue control(Cheong, Burkart, Leitão, & Lakes, 2013). A study also suggests  
370 that weather-based forecasting models using variables like mean temperature and  
371 cumulative rainfall can provide early warnings of dengue outbreaks with high sen-  
372 sitivity and specificity, enabling predictions up to 16 weeks in advance(Hii, Zhu,  
373 Ng, Ng, & Rocklöv, 2012).

374 We will utilize weather data, including variables such as temperature, rainfall,  
375 and humidity, as inputs for our dengue forecasting model. Given the strong, non-  
376 linear relationship between climate patterns and dengue incidence, these weather  
377 variables, along with their lagged effects, are essential for enhancing prediction  
378 accuracy and providing timely early warnings for dengue outbreaks.

## 379 2.7 Chapter Summary

380 This chapter reviewed key literature relevant to our study, focusing on existing  
381 systems, predictive modeling techniques and the role of weather data in forecast-  
382 ing dengue outbreaks. We examined systems like RabDash DC, which integrates  
383 predictive modeling with real-time data to inform public health decisions, provid-  
384 ing a foundational structure for our Dengue Watch System. Additionally, deep  
385 learning approaches, particularly Long Short-Term Memory (LSTM) networks,  
386 were highlighted for their effectiveness in time-series forecasting, while alternative  
387 methods such as ARIMA and Kalman Filters were considered for their ability to  
388 model complex temporal patterns and handle noisy data.

389 The literature further underscores the significance of weather variables—such  
390 as temperature and rainfall—in forecasting dengue cases. Studies demonstrate  
391 that these variables contribute to accurate outbreak prediction models. Lever-  
392 aging these insights, our study will incorporate both weather data and historical  
393 dengue case counts to build a reliable forecasting model.

<sup>394</sup>

# Chapter 3

<sup>395</sup>

## Research Methodology

<sup>396</sup> This chapter lists and discusses the specific steps and activities that will be per-  
<sup>397</sup> formed to accomplish the project. The discussion covers the activities from pre-  
<sup>398</sup> proposal to Final SP Writing.

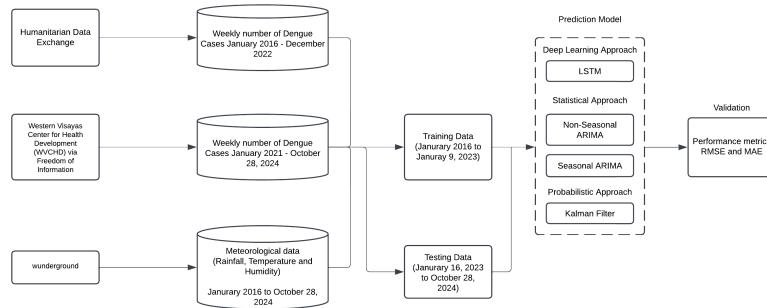

Figure 3.1: Workflow for forecasting the number of weekly dengue cases

<sup>399</sup> This summarizes the workflow for forecasting the number of weekly dengue  
<sup>400</sup> cases. This workflow focuses on using statistical, deep learning, and probabilistic  
<sup>401</sup> models to forecast the number of reported dengue cases. The approach involves  
<sup>402</sup> deploying several models for prediction, including ARIMA and Seasonal ARIMA  
<sup>403</sup> as statistical approaches, LSTM as a deep learning approach, and the Kalman  
<sup>404</sup> Filter as a probabilistic approach. These methods are compared with each other  
<sup>405</sup> to determine the most accurate model.

406 **3.1 Research Activities**

407 **3.1.1 Gather Dengue Data and Climate Data to Create a**  
408 **Complete Dataset for Forecasting**

409 **Acquisition of Dengue Case Data**

410 The historical dengue case dataset used in this study was obtained from the Hu-  
411 manitarian Data Exchange and the Western Visayas Center for Health Develop-  
412 ment (WVCHD) via Freedom of Information (FOI) requests. The decision to use  
413 weekly intervals was driven by the need for precision and timeliness in captur-  
414 ing fluctuations in dengue cases and weather conditions. Dengue transmission is  
415 influenced by short-term changes in weather variables such as rainfall and temper-  
416 ature, which impact mosquito breeding and virus transmission cycles. A weekly  
417 granularity allowed the model to better capture these short-term trends, enabling  
418 more accurate predictions and responsive public health interventions.

419 Moreover, using a weekly interval provided more data points for training the  
420 models compared to a monthly format. This is particularly critical in time series  
421 modeling, where larger datasets help improve the robustness of the model and its  
422 ability to generalize to new data. Also, the collection of weather data was done  
423 by utilizing web scraping techniques to extract weekly weather data (e.g., rainfall,  
424 temperature, and humidity) from Weather Underground ([wunderground.com](http://wunderground.com)).

425

426 **Data Fields**

- 427 • **Time.** Represents the specific year and week corresponding to each entry  
428 in the dataset.
- 429 • **Rainfall.** Denotes the observed average rainfall, measured in millimeters,  
430 for a specific week.
- 431 • **Humidity.** Refers to the observed average relative humidity, expressed as  
432 a percentage, for a specific week.
- 433 • **Max Temperature.** Represents the observed maximum temperature, mea-  
434 sured in degrees Celsius, for a specific week.
- 435 • **Average Temperature.** Represents the observed average temperature,  
436 measured in degrees Celsius, for a specific week.

- 437     • **Min Temperature.** Represents the observed minimum temperature, mea-  
438       sured in degrees Celsius, for a specific week.
- 439     • **Wind.** Represents the observed wind speed, measured in miles per hour  
440       (mph), for a specific week.
- 441     • **Cases.** Refers to the number of reported dengue cases during a specific  
442       week.

443   **Data Integration and Preprocessing**

444   The dengue case data was integrated with the weather data to create a com-  
445   prehensive dataset, aligning the data based on corresponding timeframes. The  
446   dataset undergoed a cleaning process to address any missing values, outliers, and  
447   inconsistencies to ensure its accuracy and reliability. To ensure that all features  
448   and the target variable were on the same scale, a MinMaxScaler was applied to  
449   normalize both the input features (climate data) and the target variable (dengue  
450   cases).

451   **Exploratory Data Analysis (EDA)**

- 452     • Analyzed trends, seasonality, and correlations between dengue cases and  
453       weather factors.
- 454     • Created visualizations like time series plots and scatterplots to highlight  
455       relationships and patterns in the data.

456   **Outbreak Detection**

457   To detect outbreaks, we computed the outbreak threshold value of dengue cases  
458   using the formula,

$$\text{Outbreak Threshold Value} = \mu + 2\sigma \quad (3.1)$$

459   where  $\mu$  is the historical mean and  $\sigma$  is the standard deviation.

460 **3.1.2 Develop and Evaluate Deep Learning Models for**  
461 **Dengue Case Forecasting**

462 The deep learning models were developed and trained to forecast weekly dengue  
463 cases using historical weather data (rainfall, temperature, wind, and humidity)  
464 and dengue case counts. The dataset was normalized and divided into training and  
465 testing sets, ensuring temporal continuity to avoid data leakage. The methodology  
466 for preparing and training the model are outlined below.

467 **Data Preprocessing**

468 The raw dataset included weekly aggregated weather variables (rainfall, tempera-  
469 ture, wind, humidity) and dengue case counts. The "Time" column was converted  
470 to a datetime format to ensure proper temporal indexing. To standardize the data  
471 for training, MinMaxScaler was employed, normalizing the feature values and tar-  
472 get variable to a range of 0 to 1. This step ensured that the models could efficiently  
473 process the data without being biased by feature scaling differences.

474 **LSTM Model**

475 The dataset was split into training and test sets to evaluate the model's perfor-  
476 mance and generalizability:

- 477 • **Training Set:** 80% of the data (572 sequences) was used for model training,  
478 enabling the LSTM to learn underlying patterns in historical dengue case  
479 trends and their relationship with weather variables.
- 480 • **Test Set:** The remaining 20% of the data (148 sequences) was reserved for  
481 testing

482 To prepare the data for LSTM, a sliding window approach was utilized. Se-  
483 quences of weeks of normalized features were constructed as input, while the  
484 dengue case count for the subsequent week was set as the target variable. This  
485 approach ensured that the model leveraged temporal dependencies in the data for  
486 forecasting. To enhance the performance of the LSTM model in predicting dengue  
487 cases, Bayesian Optimization was employed using the Keras Tuner library. The  
488 tuning process aimed to minimize the validation loss (mean squared error) by  
489 adjusting key model hyper-parameters. The search space is summarized below:

490        **LSTM units:**

- 491            • min value: 32
- 492            • max value: 128
- 493            • step: 16
- 494            • sampling: linear

495        **Learning Rate:**

- 496            • min value: 0.0001
- 497            • max value: 0.01
- 498            • step: None
- 499            • sampling: log

500        The tuner was instanstiated with:

- 501            • **max trials = 10:** Limiting the search to 10 different configurations
- 502            • **executions per trial = 3:** Running each configuration thrice to reduce variance
- 504            • **validation split = 0.2:** Reserving 20% of the training data for validation

505        The hyperparameter tuning was conducted for three different window sizes of  
506 data: 5, 10, and 20. This allows the model to have the optimal hyperparameters  
507 used for each window size. Training was conducted over 100 epochs with early  
508 stopping to prevent overfitting while maintaining computational efficiency. A  
509 batch size of 1 was used, enabling the model to process individual sequences,  
510 which is suitable for smaller datasets but results in longer training times. The  
511 Adam optimizer, known for its adaptive learning capabilities and stability was  
512 employed.

513        To validate the effectiveness of the model, cross-validation was implemented.  
514 However, standard k-fold cross-validation randomly shuffles the data, which isn't  
515 suitable for time series since the order of observations is important. To address  
516 this, a time series-specific cross-validation strategy was used with TimeSeriesS-  
517 split from the scikit-learn library. This method creates multiple train-test splits

518 where each training set expands over time and each test set follows sequentially.  
519 This approach preserves the temporal structure of the data while helping reduce  
520 overfitting by validating the model across different time segments.

521 After training, predictions on both the training and test datasets were rescaled  
522 to their original scale using the inverse transformation of MinMaxScaler. Model  
523 performance was evaluated using the mean squared error (MSE), root mean  
524 squared error (RMSE) and mean absolute error (MAE).

525 **ARIMA**

526 The ARIMA model was utilized to forecast weekly dengue cases, leveraging histori-  
527 cal weather data—including rainfall, maximum temperature, and humidity—as  
528 exogenous variables alongside historical dengue case counts as the primary depen-  
529 dent variable. The dataset was partitioned into training (80%) and testing (20%)  
530 sets while maintaining temporal consistency.

531 To identify the optimal ARIMA configuration, a comprehensive grid search  
532 was performed across the following parameter ranges:

- 533     • Autoregressive order (p): 0 to 3
- 534     • Differencing order (d): 0 to 2
- 535     • Moving average order (q): 0 to 3

536 Each combination of (p,d,q) was used to fit an ARIMA model, and perfor-  
537 mance was evaluated based on the mean squared error (MSE) between the pre-  
538 dicted and actual dengue cases on the test set. The parameter set that achieved  
539 the lowest MSE was selected as the final model configuration.

540 Following model selection, the best-fit ARIMA model was retrained on the  
541 training set and subsequently used to forecast dengue cases for the test period.  
542 The predictions were assigned to the **PredictedCases** column in the test dataset.  
543 Model performance was further assessed using key evaluation metrics, including  
544 MSE, root mean squared error (RMSE), and mean absolute error (MAE). Visual  
545 comparisons between actual and predicted dengue cases were produced through  
546 line plots to better illustrate the model's forecasting accuracy.

547 **Seasonal ARIMA (SARIMA)**

548 The SARIMA modeling process began with data preprocessing, which included  
549 handling missing values through interpolation or imputation, and standardizing  
550 features to ensure stable model training. The dataset was then split into training  
551 and testing sets in an 80:20 ratio, preserving the temporal order of observations.  
552 Seasonality analysis was conducted using time series decomposition and autocor-  
553 relation plots, which revealed a periodicity of 52 weeks—justifying the adoption  
554 of a seasonal model. To fine-tune the model, a grid search was performed over a  
555 range of SARIMA parameters  $(p,d,q)(P,D,Q)[S]$ , while stationarity was validated  
556 using the Augmented Dickey-Fuller (ADF) test. The model was then trained  
557 on the dataset using rainfall, temperature, and humidity as exogenous variables,  
558 with convergence ensured by setting a maximum number of iterations. Residual  
559 diagnostics were used to confirm that residuals were uncorrelated, indicating a  
560 good model fit. For evaluation, forecasts were compared against actual values,  
561 and results were visualized with line plots. Finally, to validate the model's gener-  
562 alizability across different time periods, Time Series Cross-Validation with three  
563 folds was applied. This allowed assessment of the model's performance on multi-  
564 ple time segments, providing insights into its robustness in real-world forecasting  
565 scenarios.

566 **Kalman Filter:**

- 567 • Input Variables: The target variable (Cases) was modeled using three re-  
568 gressors: rainfall, max temperature, and humidity.
- 569 • Training and Testing Split: The dataset was split into 80% training and  
570 20% testing to evaluate model performance.
- 571 • Observation Matrix: The Kalman Filter requires an observation matrix,  
572 which was constructed by adding an intercept (column of ones) to the re-  
573 gressors.

574 The Kalman Filter's Expectation-Maximization (EM) method was employed  
575 for training, iteratively estimating model parameters over 10 iterations. After  
576 training, the smoothing method was used to compute the refined state estimates  
577 across the training data. Observation matrices for the test data were constructed  
578 in the same manner as for the training set, ensuring compatibility with the learned  
579 model parameters. On the test data, the Kalman Filter applied these parameters  
580 to predict and correct the estimated dengue cases, providing more stable and  
581 accurate forecasts compared to direct regression models. Additionally, a hybrid

582 Kalman Filter–LSTM (KF-LSTM) model was developed to combine the strengths  
583 of both approaches. In this setup, the LSTM model was first used to predict  
584 dengue cases based on historical data and weather features. The Kalman Filter  
585 was then applied as a post-processing step to the LSTM predictions, smoothing  
586 out noise and correcting potential errors.

587 **3.1.3 Integrate the Predictive Model into a Web-Based**  
588 **Data Analytics Dashboard**

589 **Dashboard Design and Development**

- 590 • Design an intuitive, user-friendly web-based dashboard incorporating:
- 591 – Interactive visualizations of yearly dengue case trends.  
592 – Data input and update forms for dengue and weather data.  
593 – Map display of dengue cases in each district in Iloilo City

594 **Model Integration and Deployment**

- 595 • Deploy the best-performing model within the dashboard as a backend service  
596 to enable real-time or periodic forecasting.

597 **3.1.4 System Development Framework**

598 The Agile Model is the birthchild of both iterative and incremental approaches  
599 in Software Engineering. It aims to be flexible and effective at the same time by  
600 being adaptable to change. It's also important to note that small teams looking  
601 to construct and develop projects quickly can benefit from this kind of method-  
602 ology. As the Agile Method focuses on continuous testing, quality assurance is a  
603 guarantee since bugs and errors are quickly identified and patched.

604 **Design and Development**

605 After brainstorming and researching the most appropriate type of application to  
606 accommodate both the prospected users and the proposed solutions, the team  
607 has decided to proceed with a web application. Given the time constraints and  
608 available resources, it has been decided that the said means is the most pragmatic

609 and practical move. The next step is to select modern and stable frameworks  
610 that align with the fundamental ideas learned by the researchers in the university.  
611 The template obtained from WVCHD and Iloilo Provincial Epidemiology and  
612 Surveillance Unit was meticulously analyzed to create use cases and develop a  
613 preliminary well-structured database that adheres to the requirements needed  
614 to produce a quality application. The said use cases serve as the basis of general  
615 features. Part by part, these are converted into code, and with the help of selected  
616 libraries and packages, it resulted in the desired outcome that may still modified  
617 and extended to achieve scalability.

## 618 Testing and Integration

Figure 3.2: Testing Process for DengueWatch

619 Implementing testing is important to validate the system's performance and ef-  
620 ficacy. Thus a series of tests were conducted to identify and resolve bugs during  
621 the developmental phase. Each feature was rigorously tested to ensure quality as-  
622 surance, with particular emphasis on prerequisite features, as development cannot  
623 progress properly if these fail. Because of this, integration between each feature

624 serves as a pillar for a cohesive user experience. Since dengue reports include  
625 confidential information, anonymized historical dengue reports were used to train  
626 the model and create the foundational architecture of the system. By using func-  
627 tional tests, data validation and visualization can be ensured for further continual  
628 improvements. Security testing is also important as it is needed to safeguard  
629 confidential information when the system is deployed. It includes proper authen-  
630 tication, permission views, and mitigating common injection attacks. Finally, a  
631 user acceptance test from the prospected users, in this case, doctors, nurses, and  
632 other health workers is crucial to assess its performance and user experience. It  
633 enables the developers to confirm if the system meets the needs of the problem.

## 634 **3.2 Development Tools**

### 635 **3.2.1 Software**

#### 636 **Github**

637 GitHub is a cloud-based platform that tracks file changes using Git, an open-  
638 source version control system (*About GitHub and Git - GitHub Docs*, n.d.). It is  
639 used in the project to store the application's source code, manage the system's  
640 source version control, and serve as a repository for the Latex files used in the  
641 actual research.

#### 642 **Visual Studio Code**

643 Visual Studio Code is a free, lightweight, and cross-platform source code editor  
644 developed by Microsoft (*Why Visual Studio Code?*, 2021). As VS Code supports  
645 this project's programming and scripting languages, it was chosen as the primary  
646 source code editor.

#### 647 **Django**

648 Django is a free and open-sourced Python-based web framework that offers an  
649 abstraction to develop and maintain a secure web application. As this research  
650 aims to create a well-developed and maintainable application, it is in the best  
651 interest to follow an architectural pattern that developers and contributors in the

652 future can understand. Since Django adheres to Model-View-Template (MVT)  
653 that promotes a clean codebase by separating data models, business logic, and  
654 presentation layers, it became the primary candidate for the application's back-  
655 bone.

### 656 **Next.js**

657 A report by Statista (2024) claims that React is the most popular front-end frame-  
658 work among web developers. However, React has limitations that can be a nui-  
659 sance in rapid software development, which includes routing and performance op-  
660 timizations. This is where Next.js comes in—a framework built on top of React.  
661 It offers solutions for React's deficiency, making it a rising star in the framework  
662 race.

### 663 **Postman**

664 As the application heavily relies on the Application Programming Interface (API)  
665 being thrown by the backend, it is a must to use a development tool that facilitates  
666 the development and testing of the API. Postman is a freemium API platform  
667 that offers a user-friendly interface to create and manage API requests (*What is*  
668 *Postman? Postman API Platform*, n.d.).

### 669 **3.2.2 Hardware**

670 The web application was developed on laptop computers with minimum specifica-  
671 tions of an 11th-generation Intel i5 CPU and 16 gigabytes of RAM. Furthermore,  
672 an RTX 3060 mobile GPU was also utilized to retrain the integrated model locally.

### 673 **3.2.3 Packages**

#### 674 **Django REST Framework**

675 Django Rest Framework (DRF) is a third-party package for Django that provides a  
676 comprehensive suite of features to simplify the development of robust and scalable  
677 Web APIs (Christie, n.d.). These services include Serialization, Authentication  
678 and Permissions, Viewsets and Routers, and a browsable API .

679 **Leaflet**

680 One of the features of the web application is the ability to map the number  
681 of cases using a Choropleth Map. Leaflet is the only free, open-sourced, and  
682 most importantly, stable JavaScript package that can do the job. With its ultra-  
683 lightweight size, it offers a comprehensive set of features that does not trade  
684 off performance and usability (*Leaflet — an open-source JavaScript library for*  
685 *interactive maps*, n.d.).

686 **Chart.js**

687 Another feature of the application is to provide users with informative, approach-  
688 able data storytelling that is easy for everyone to understand. The transformation  
689 of pure data points and statistics into figures such as charts is a big factor. Thus,  
690 there is a need for a package that can handle this feature without compromising  
691 the performance of the application. Chart.js is a free and open-source JavaScript  
692 package that is made to meet this criteria as it supports various types of charts  
693 (*Chart.js*, n.d.).

694 **Tailwind CSS**

695 Using plain CSS in production-quality applications can be counterproductive.  
696 Therefore, CSS frameworks were developed to promote consistency and accelerate  
697 the rapid development of web applications (Joel, 2021). One of these is Tailwind,  
698 which offers low-level utility classes that can be applied directly to each HTML  
699 element to create a custom design (*Tailwind CSS - Rapidly build modern web-*  
700 *sites without ever leaving your HTML.*, n.d.). Given the limited timeline for this  
701 project, using this framework is a wise choice due to its stability and popularity  
702 among developers.

703 **Shadcn**

704 Shadcn offers a collection of open-source UI boilerplate components that can be  
705 directly copied and pasted into one's project. With the flexibility of the provided  
706 components, Shadcn allows developers to have full control over customization and  
707 styling. Since this is built on top of Tailwind CSS and Radix UI, it is supported  
708 by most modern frontend frameworks, including Next.js (Shadcn, n.d.).

709 **Zod**

710 Data validation is integral in this web application since it will handle crucial data  
711 that will be used for analytical inferences and observations. Since Zod is primarily  
712 used for validating and parsing data, it ensures proper communication between  
713 the client and the server (Zod, n.d.).

714 **3.3 Application Requirements**

715 **3.3.1 Backend Requirements**

716 **Database Structure Design**

717 Determining how data flows and how it would be structured is crucial in creating  
718 the system as it defines how extendible and flexible it would be for future features  
719 and updates. Thus, creating a comprehensive map of data ensures proper nor-  
720 malization that eliminates data redundancy and improves data integrity. Figure  
721 3.3 depicts the designed database schema that showcases the relationship between  
722 the application's entities.

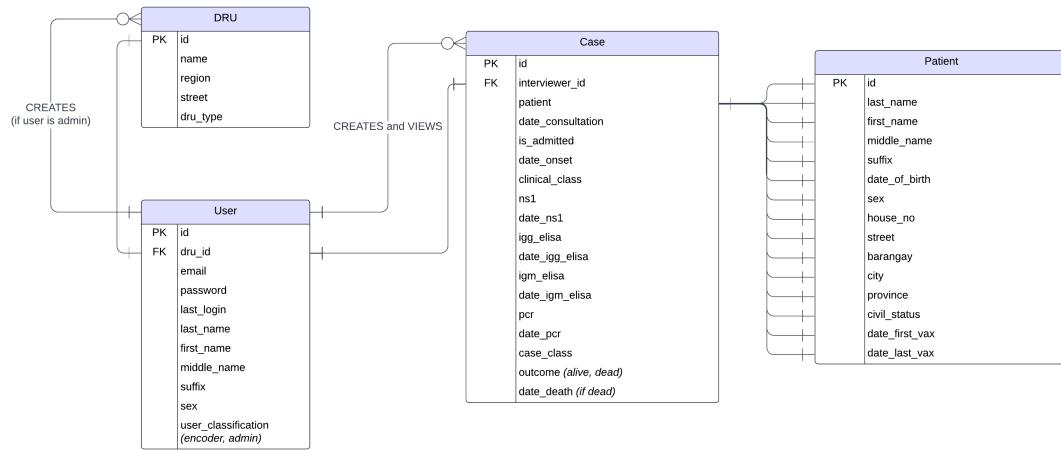

Figure 3.3: Entity-Relationship Database Schema Hybrid Diagram for DengueDash Database Structure

### <sup>723</sup> 3.3.2 User Interface Requirements

#### <sup>724</sup> Admin Interface

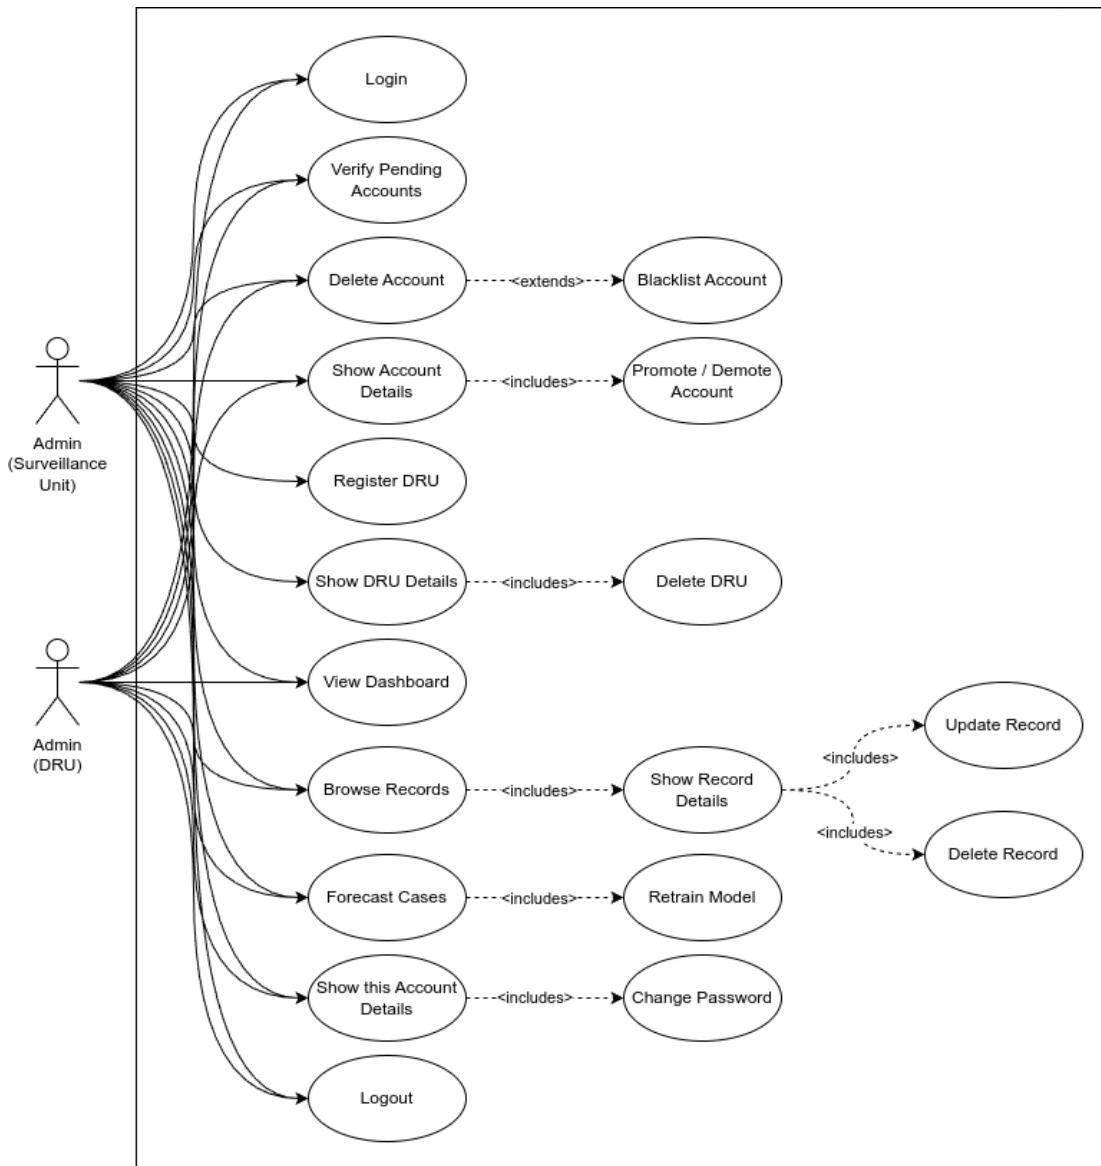

Figure 3.4: Use Case Diagram for Admins

<sup>725</sup> Figure 3.4 shows the actions of an admin for a specific Disease Reporting Unit (DRU) and an admin for a specific Surveillance Unit can take in the application.  
<sup>726</sup> Both of them include the management of accounts, browsing records, and fore-  
<sup>727</sup> casting and retraining all the consolidated data under their supervision. Most  
<sup>728</sup> of the actions involve managing accounts and browsing records.

729 importantly, these users must verify the encoders who register under their ju-  
730 risdiction before allowing their account to access the application in the name of  
731 safeguarding the integrity of the data. The only advantage of the latter type of ad-  
732 ministrator is that it has a one-step higher authorization as it manages the DRUs.  
733 In addition, only the authorized surveillance unit administrator can register and  
734 create a DRU to uphold transparency and accountability.

### 735 Encoder Interface

Figure 3.5: Use Case Diagram for Encoder

736 Figure 3.5, on the other hand, illustrates the use cases for the system's primary  
737 users. These users can register but must wait for further verification to access the  
738 application. Similar to the previous interfaces, encoders can browse and manage  
739 records, as well as forecast the consolidated cases under a specific surveillance or  
740 disease reporting unit, but they are not allowed to retrain the model. Lastly, they

741 are the only type of user that can file and create dengue cases by filling out a form  
742 with the required details.

### 743 3.3.3 Security and Validation Requirements

#### 744 Password Encryption

745 Storing passwords as plain text in the database is a disgrace and a mortal sin in  
746 production. It is important to implement precautionary methods such as hashing  
747 and salting, followed by encryption with a strong algorithm, to prevent bad actors  
748 from using the accounts for malicious transactions. By default, Django generates  
749 a unique random salt for each password and encrypts it with Password-Based Key  
750 Derivation Function 2 (PBKDF2) with a SHA256 hash function. Utilizing these  
751 techniques ensures that in the event of a data breach, cracking these passwords  
752 would be time-consuming and useless for the attackers.

#### 753 Authentication

754 DengueWatch utilizes JSON Web Tokens (JWT) to authenticate the user. Since  
755 the mechanism operates in a stateless manner, tokens are served only after a  
756 successful login, eliminating the need for the server to keep a record of the token,  
757 which is vulnerable to session hijacking. In addition, these tokens are signed with  
758 a secret key, ensuring they have not been tampered with.

#### 759 Data Validation

760 Both the backend and frontend should validate the input from the user to preserve  
761 data integrity. Thus, Zod is implemented in the latter to help catch invalid inputs  
762 from the user. By doing this, the user can only send proper requests to the server  
763 which streamlines the total workflow. On the other hand, Django has also a built-  
764 in validator that checks the data type and ensures that the input matches the  
765 expected format on the server side. These validation processes ensure that only  
766 valid and properly formatted data is accepted, which reduces the risk of errors  
767 and ensures consistency across the web application.

## 768 3.4 Calendar of Activities

769 A Gantt chart showing the schedule of the activities is included below. Each  
770 bullet represents approximately one week of activity.

Table 3.1: Timetable of Activities for 2024

# <sup>771</sup> Chapter 4

## <sup>772</sup> Results and Discussion/System <sup>773</sup> Prototype

### <sup>774</sup> 4.1 Data Gathering

<sup>775</sup> The data for dengue case prediction was gathered from a variety of reliable sources,  
<sup>776</sup> enabling a comprehensive dataset spanning from January 2011 to October 2024.  
<sup>777</sup> This dataset includes 720 rows of data, each containing weekly records of dengue  
<sup>778</sup> cases along with corresponding meteorological variables, such as rainfall, temper-  
<sup>779</sup> ature, and humidity.

- <sup>780</sup> 1. Dengue Case Data: The primary source of historical dengue cases came  
<sup>781</sup> from the Humanitarian Data Exchange and the Western Visayas Center for  
<sup>782</sup> Health Development (WVCHD). The dataset, accessed through Freedom of  
<sup>783</sup> Information (FOI) requests, provided robust case numbers for the Western  
<sup>784</sup> Visayas region. The systematic collection of these data points was essential  
<sup>785</sup> for establishing a reliable baseline for model training and evaluation.
- <sup>786</sup> 2. Weather Data: Weekly weather data was obtained by web scraping from  
<sup>787</sup> Weather Underground, allowing access to rainfall, temperature, wind, and  
<sup>788</sup> humidity levels that correlate with dengue prevalence.

data.head()									
	Time	Rainfall	MaxTemperature	AverageTemperature	MinTemperature	Wind	Humidity	Cases	
0	2011-01-03	9.938571	29.444400	25.888890	23.888900	11.39	86.242857	5

## 789 4.2 Exploratory Data Analysis

790 From the summary above, the dataset consists of 720 weekly records with 8  
 791 columns:

- 792 • **Time.** Weekly timestamps (e.g. "2011-w1")
- 793 • **Rainfall.** Weekly average rainfall (mm)
- 794 • **MaxTemperature, AverageTemperature, MinTemperature.** Weekly  
 795 temperature data (C)
- 796 • **Wind.** Wind speed (m/s)
- 797 • **Humidity.** Weekly average humidity (%)
- 798 • **Cases.** Reported dengue cases

	Time	Rainfall	MaxTemperature	AverageTemperature	MinTemperature	Wind	Humidity	Cases
count	720	720.000000	720.000000	720.000000	720.000000	720.000000	720.000000	720.000000

Figure 4.3: Dataset Statistics

799 From the statistics in figure 4.3, the number of cases ranges from 0 to 319.  
800 The average number of dengue cases per week is 23.74, with a median of 12 cases  
801 and a standard deviation of 37.14. The distribution is highly skewed, with some  
802 weeks experiencing significant number of cases (up to 319 cases). Rainfall shows  
803 a wide variation (0 to 445mm), while temperature remains relatively stable, with  
804 an average of 28.1 degree celsius. Humidity levels ranges from 73% to 89% with  
805 a mean of 81.6%.

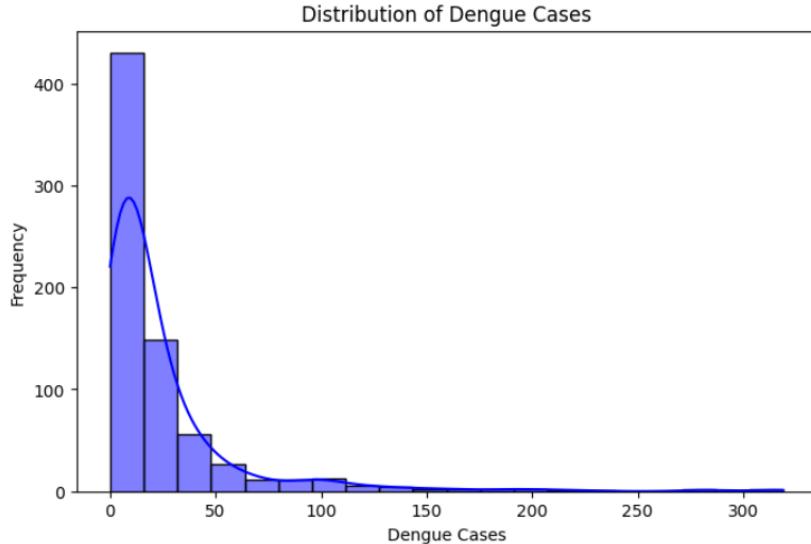

Figure 4.4: Distribution of Dengue Cases

806 In figure 4.4, a histogram of dengue cases shows a right-skewed distribution,  
807 indicating that most weeks experience low case counts, while a few weeks record  
808 outbreaks.  
809 To further analyze the distribution, dengue cases were categorized into different  
810 intervals (Figure 4.5): 0-5 cases, 6-15 cases, 16-30 cases, 31-100 cases and 101+

811 cases. The majority of weeks falls within the 0-5 cases and 6-15 cases categories,  
812 indicating that most weeks have low dengue cases. Meanwhile, weeks with 101+  
cases are rare, suggesting that extreme outbreaks are not frequent.

Figure 4.5: Frequency of Dengue Cases in Different Intervals

813

814 Figure 4.6 illustrates the trend of weekly dengue cases over time. The data  
815 reveals periodic spikes in the number of cases, suggesting a seasonal pattern in  
816 dengue cases. Notably, peak cases are observed during certain periods approx-  
817 imately 3 years, potentially aligning with specific climatic conditions such as  
818 increased rainfall or temperature changes. This underscores the importance of  
819 incorporating climate variables into the forecasting model.

820 Figure 4.7 shows the ranking of correlation coefficients between dengue cases  
821 and selected features, including rainfall, humidity, maximum temperature, aver-  
822 age temperature, minimum temperature, and wind speed. Among these, rainfall  
823 exhibits the highest positive correlation with dengue cases (correlation coefficient  
824 0.13), indicating that increased rainfall may contribute to higher cases counts.  
825 This aligns with existing studies suggesting that stagnant water from heavy rain-  
826 fall creates breeding grounds for mosquitos. It is followed by humidity ( 0.10),  
827 suggesting that higher humidity levels may enhance mosquito reproduction, lead-  
828 ing to more dengue cases. Temperature has a weak to moderate positive corre-  
829 lation with dengue cases, with maximum temperature (0.09) showing a stronger  
830 relationship than average and minimum temperature.

831 Figure 4.8 shows the distributions of each feature while Figure 4.9 shows scat-  
832 terplots of each feature against the number of cases. The distributions of Rainfall,

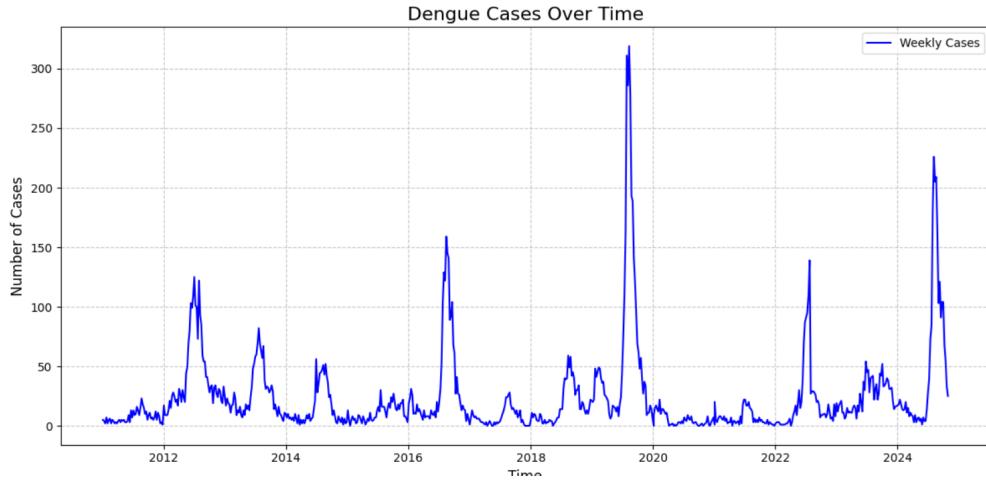

Figure 4.6: Trend of Dengue Cases

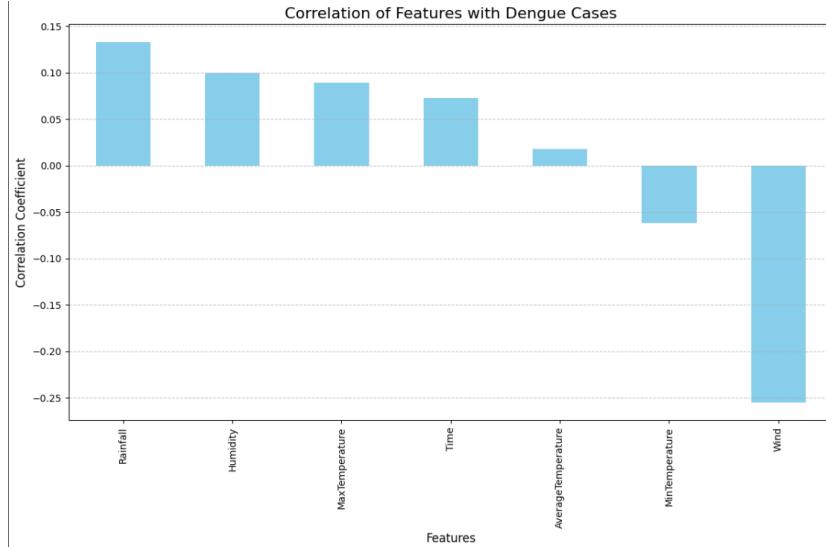

Figure 4.7: Ranking of Correlations

833 Max Temperature, Min Temperature, and Wind appear skewed, which is common  
 834 for many real-world variables. This skewness can distort correlation estimates, as  
 835 Pearson correlation assume linear relationships and are more reliable when vari-  
 836 ables follow a symmetric or approximately normal distribution (Bobbitt, 2021).  
 837 Applying a log transformation can help normalize these distributions, improve  
 838 linearity, and thus lead to more meaningful and accurate correlation analysis.

839 After applying a log transformation, Figure 4.10 shows the new distributions  
 840 for the previously skewed distributions, while Figure 4.11 shows the new scatter-  
 841 plots of each feature against the number of cases. Now, all distributions exhibit a

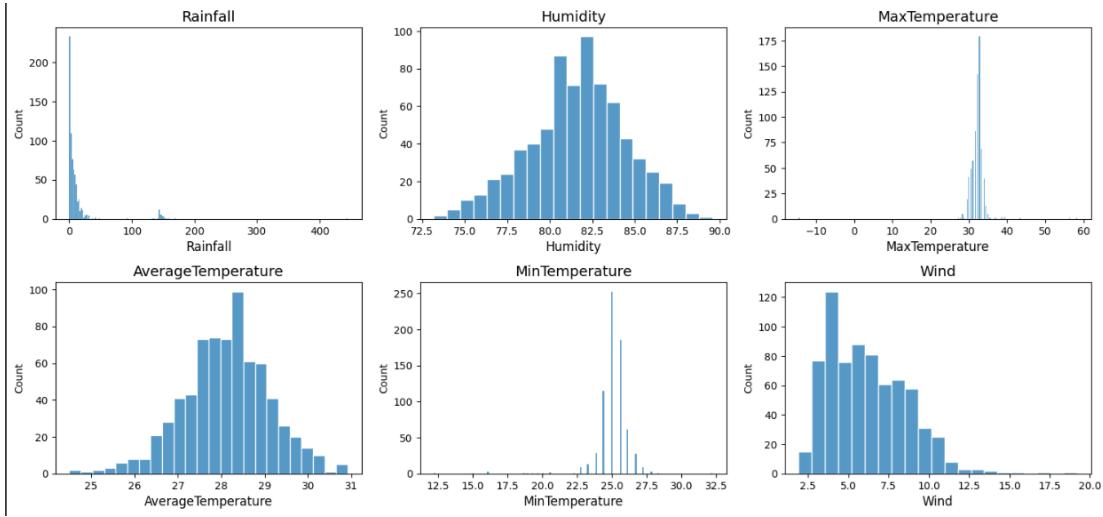

Figure 4.8: Pre-Transform Feature Distributions

Figure 4.9: Scatterplots

842 somewhat normal distribution which is ideal for computing linear computations  
 843 such as Pearson's correlation.

844 Figure 4.12 presents the recomputed correlation coefficients between dengue  
 845 cases and the log-transformed weather features. Rainfall shows the strongest cor-  
 846 relation at 0.16, followed by Max Temperature at 0.12, and Humidity at 0.10.  
 847 While other features are included, their correlation values are very small and not  
 848 considered meaningful. Although the individual correlations are weak, they pro-  
 849 vide valuable signals that, when combined in a multivariate model, may contribute  
 850 meaningfully to predictive performance., As a result, Rainfall, Max Temperature,

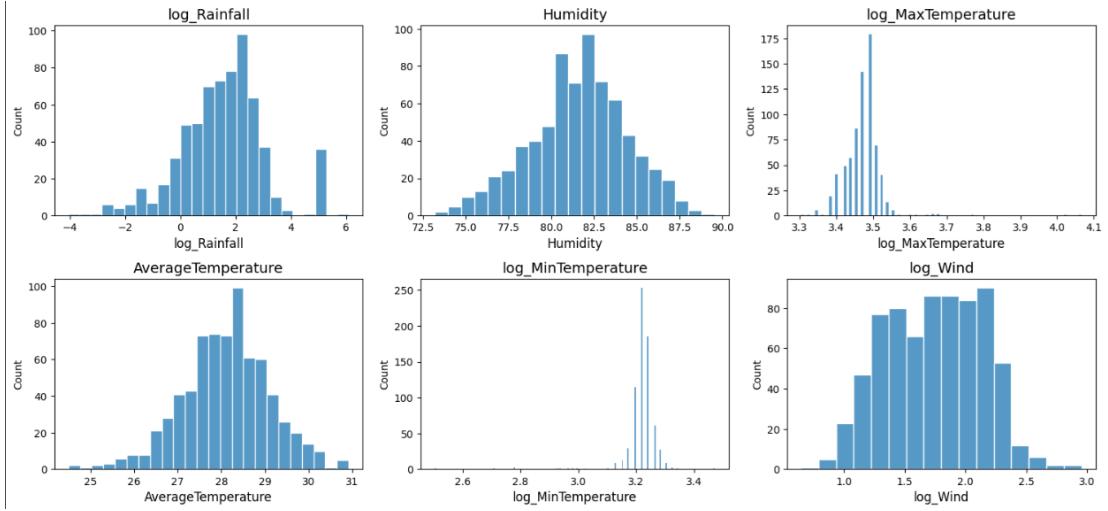

Figure 4.10: Post-Transform Feature Distributions

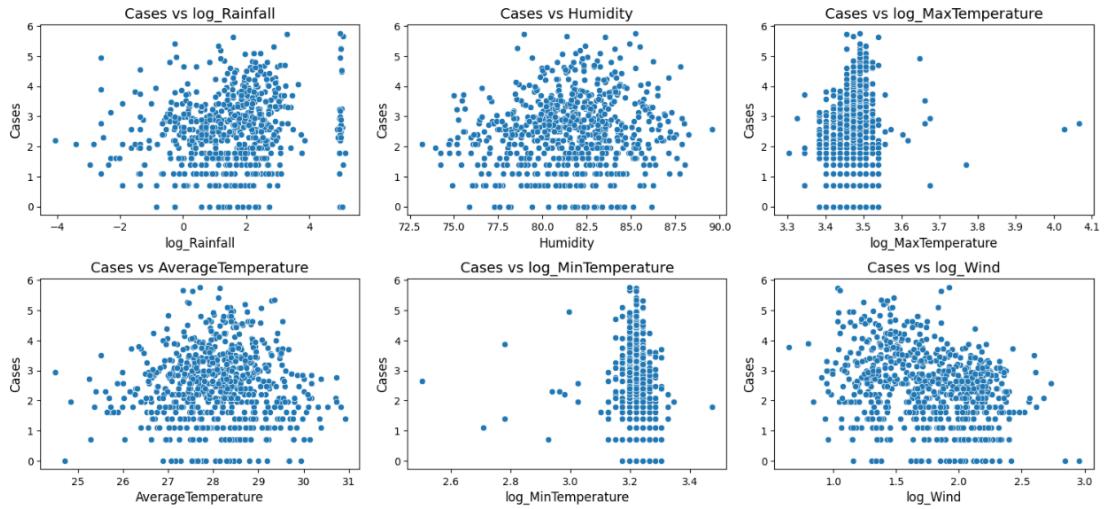

Figure 4.11: Transformed Distributions: Scatterplots

851 and Humidity are selected as the key features for model training.

### 852 4.3 Outbreak Detection

853 To identify outbreaks, we calculated the outbreak threshold value using the historical  
 854 mean as the endemic channel. The threshold is determined using the formula:

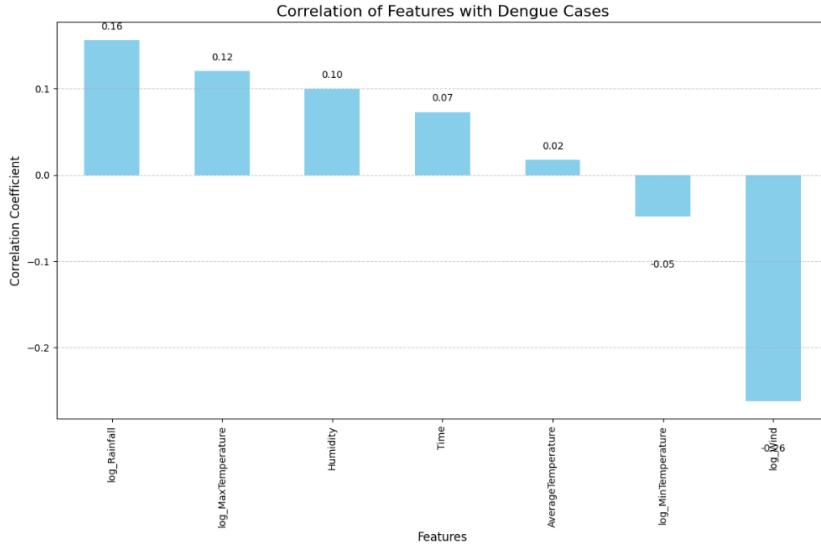

Figure 4.12: Ranking of Correlations with New Distributions

$$\text{Outbreak Threshold Value} = \mu + 2\sigma \quad (4.1)$$

$$= 23.744444 + 2(37.144813) \quad (4.2)$$

$$= 23.744444 + 74.289626 \quad (4.3)$$

$$= 98.03407 \quad (4.4)$$

855 where  $\mu$  is the historical mean and  $\sigma$  is the standard deviation.

856 This result indicates that dengue cases exceeding 98 in Iloilo City can be  
 857 considered an outbreak. However, it is important to note that this threshold  
 858 serves only as a baseline. Additional parameters, such as the number of hospital  
 859 beds available in the city, must be considered to compute a more effective threshold  
 860 and develop an appropriate response strategy.

## 861 4.4 Model Training Results

862 The models were evaluated using three metrics: MSE, RMSE, and MAE. The  
 863 table below provides a summary and comparative analysis of each model's results  
 864 across these metrics, offering insights into the strengths and limitations of each  
 865 forecasting technique for dengue case prediction in Iloilo City. The lower values  
 866 of the three metrics indicate better forecasting performance. Table 4.1 shows that

867 the models performed differently on testing data. LSTM outperformed the other  
 868 models with the lowest RMSE, MSE, and MAE while the other three models had  
 869 relatively higher values for the three metrics.

Method	LSTM	Seasonal ARIMA	ARIMA	Kalman Filter	KF-LSTM
Testing MSE	285.54	1261.20	1521.48	1474.82	785.35
Testing RMSE	16.90	34.45	39.00	38.40	25.56
Testing MAE	9.45	18.73	25.80	22.33	14.55
Best Parameters	Window Size: 5 Learning Rate: 0.01 Units: 64	(2,0,2)(0,1,1)	(1,2,2)	Observation Covariance: 10.0 Transition Covariance: $0.1 \times \text{Identity}$	Same as LSTM

Table 4.1: Comparison of different models for dengue prediction

#### 870 4.4.1 LSTM Model

871 The LSTM model was tuned for the following parameters: learning rate and units.  
 872 The hyperparameter tuning was conducted for each window size, finding the best  
 873 parameters for each window size. Further evaluating which window size is most  
 874 suitable for the prediction model, Table 4.2 shows the evaluation metrics for each  
 window size used in the LSTM model training.

Window Size	MSE	RMSE	MAE	R <sup>2</sup>
5	285.54	16.90	9.45	0.83
10	334.63	18.29	9.85	0.80
20	294.85	17.17	9.35	0.83

Table 4.2: Comparison of Window Sizes

875  
 876 The results indicate that a window size of 5 weeks provides the most accurate  
 877 predictions, as evidenced by the lowest MSE and RMSE values. Furthermore, the  
 878 R<sup>2</sup> score of 0.83 indicates that 83% of the variability in the target variable (cases)  
 879 is explained by the independent variables (the inputs) in the model, making it a  
 880 reliable configuration overall.

881 As shown in Table 4.3, the results from time series cross-validation indicate  
 882 consistent performance trends, with a window size of 5 yielding the highest average  
 883 RMSE across all folds compared to the other window sizes.

884 Figure 4.13 illustrates the model's performance in predicting dengue cases  
 885 for each fold using a window size of 5. As shown in the plot, the training set  
 886 progressively increases with each fold, mimicking a real-world scenario where more  
 887 data becomes available over time for dengue prediction. Figure 4.14 demonstrates  
 888 that the predicted cases closely follow the trend of the actual cases, indicating

Window Size	Average RMSE	Average MAE	Average R <sup>2</sup>
5	16.69	9.06	0.79
10	17.08	10.40	0.75
20	16.93	8.75	0.81

Table 4.3: Time-Series Cross Validation Results: Comparison of Window Sizes

889 that the LSTM model successfully captures the underlying patterns in the data.  
890 It is also evident that as the fold number increases and the training set grows, the  
891 accuracy of the predictions on the test set improves. Despite the test data being  
892 unseen, the model exhibits a strong ability to generalize, suggesting it effectively  
893 leverages past observations to predict future trends.

Figure 4.13: Training Folds - Window Size 5

Figure 4.14: Testing Folds - Window Size 5

894    **4.4.2 ARIMA Model**

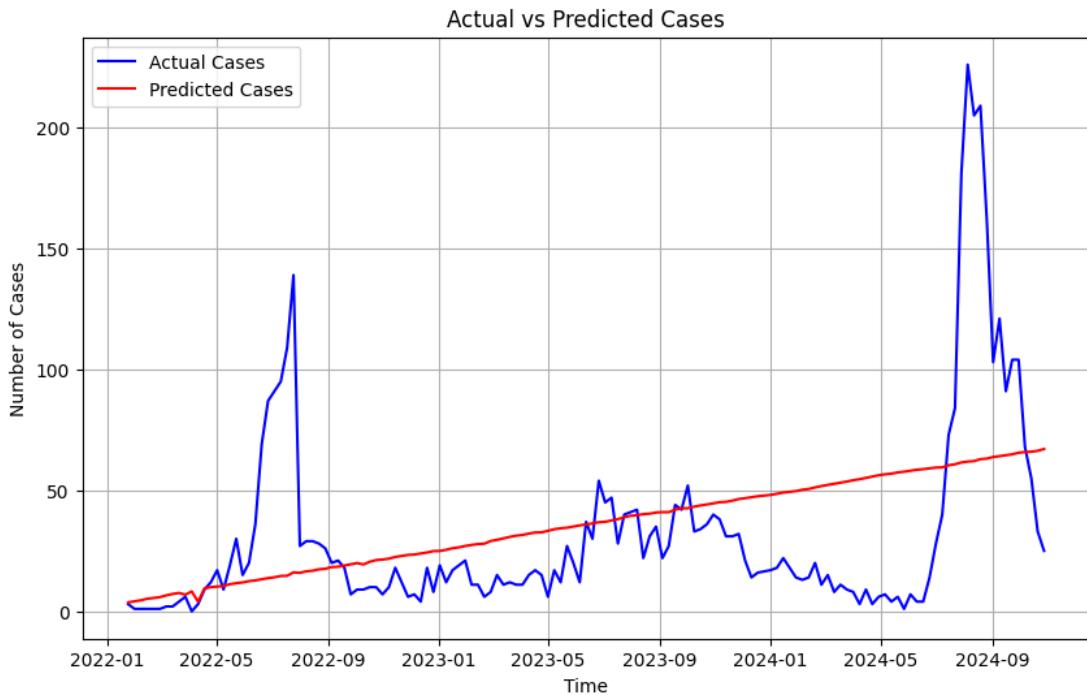

Figure 4.15: ARIMA Prediction Results for Test Set

895    The ARIMA model was developed to capture non-seasonal trends in the data.  
896    To determine the best model configuration, grid search was used to explore vari-  
897    ous combinations of ARIMA parameters, ultimately selecting **ARIMA(1, 2, 2)**.  
898    The model was iteratively refined over **400 iterations** to ensure convergence to  
899    an optimal solution. Figure 4.15 illustrates the comparison between actual and  
900    predicted dengue cases in the test set. As shown in the plot, the ARIMA model  
901    struggled to capture the non-linear characteristics and abrupt spikes in the data.  
902    Consequently, it failed to accurately reflect the fluctuations and outbreak patterns  
903    seen in the actual case counts.

904        The model's performance was assessed using regression metrics to evaluate its  
905    forecasting capability. The ARIMA model yielded the following error metrics:

- 906        • **MSE (Mean Squared Error):** 1521.48  
907        • **RMSE (Root Mean Squared Error):** 39.01  
908        • **MAE (Mean Absolute Error):** 25.80

#### 909 4.4.3 Seasonal ARIMA (SARIMA) Model

910 To address the limitations of the ARIMA model, a Seasonal ARIMA (SARIMA)  
911 model was developed to capture both non-seasonal and seasonal variations in the  
912 data.

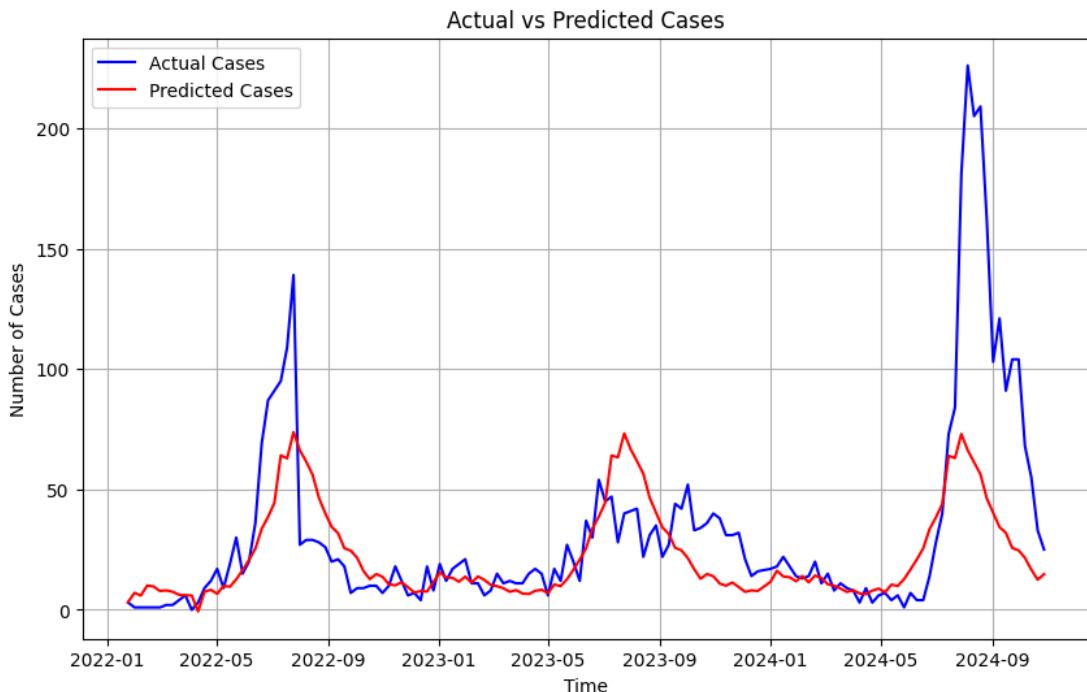

Figure 4.16: Seasonal ARIMA Prediction Results for Test Set

913 This model incorporates seasonal parameters, which were tuned using grid  
914 search to find the best configuration: **SARIMA(2, 0, 2)(0, 1, 1)[52]**. As with  
915 ARIMA, **400 iterations** were applied to ensure a robust fit. As shown in Figure  
916 4.16, the SARIMA model demonstrates a notable improvement in performance.  
917 Unlike its non-seasonal counterpart, it effectively captures the general trend and  
918 aligns more closely with the peaks observed in the actual dengue cases, indicating  
919 its ability to model seasonal dynamics.

920 The model's performance was assessed using regression metrics to evaluate its  
921 forecasting capability. The SARIMA model yielded the following error metrics:

- 922 • **MSE:** 1109.69  
923 • **RMSE:** 33.31

924 • MAE: 18.09

925 The lower error values, when compared to the ARIMA model, highlight the  
926 SARIMA model's superior capability in forecasting dengue cases. Its effective-  
927 ness in capturing seasonal patterns contributed to a more accurate representation  
928 of the actual cases.

929 After training the model, the SARIMA model was validated using the same  
930 Time Series Cross-Validation strategy employed in the LSTM model. Table 4.4  
931 presents the performance metrics for each fold, as well as the average metrics  
932 across all folds. The average RMSE and MAE values were close to those obtained  
933 during the initial training phase, indicating that the SARIMA model performed  
934 consistently across different time segments.

Fold	MSE	RMSE	MAE
1	659.68	25.68	16.00
2	2127.49	46.12	21.30
3	996.43	31.56	18.89
<b>Average</b>	<b>1261.20</b>	<b>34.45</b>	<b>18.73</b>

Table 4.4: Comparison of SARIMA performance for each fold

#### 935 4.4.4 Kalman Filter Model

936 Figure 4.17 shows the comparison between the actual dengue cases and the pre-  
937 dicted values on the test set. As illustrated in the plot, the Kalman Filter model  
938 demonstrates a moderate ability to follow the general trend of the actual data.  
939 While it effectively captures some rising and falling patterns, it still struggles to  
940 accurately replicate the sharp peaks and extreme values found in the real case  
941 counts. This limitation is particularly noticeable during the large spikes in 2022  
942 and 2024. The model's performance was evaluated using standard regression met-  
943 rics. The results are as follows:

$$\text{MSE} = 1474.82, \quad \text{RMSE} = 38.40, \quad \text{MAE} = 22.34$$

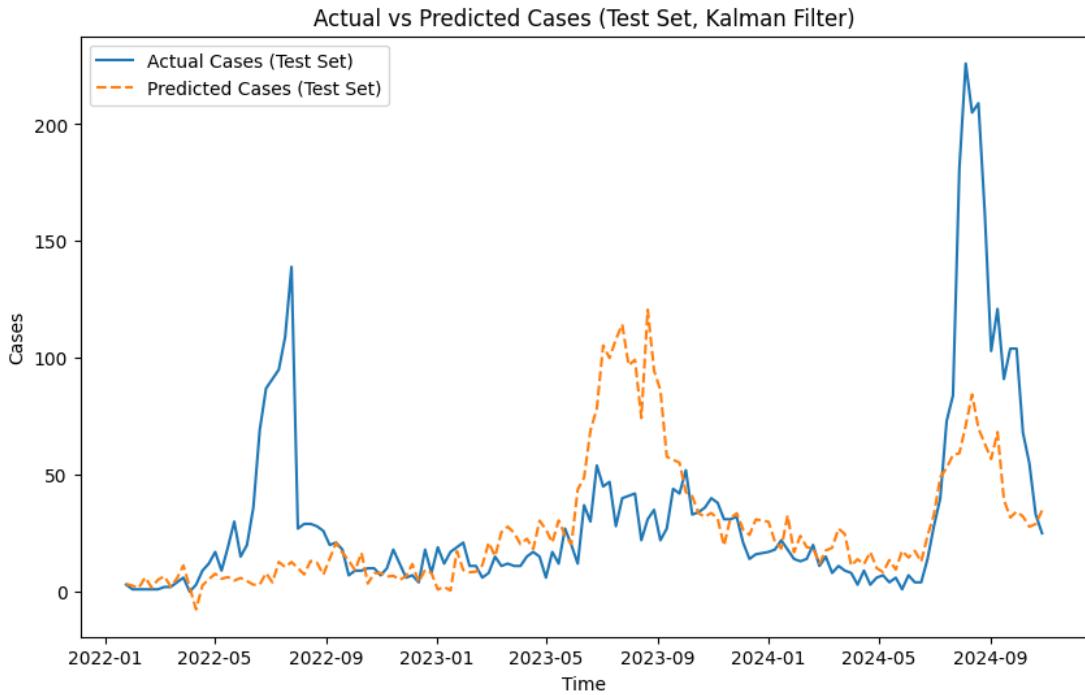

Figure 4.17: Kalman Filter Prediction Results for Test Set

944        The Kalman Filter was then combined with the LSTM model in order to see  
 945        improvements in its predictions. Table 4.5 shows the metrics across three folds  
 946        using the same Time Series Cross Validation Strategy employed in the previous  
 947        models to see how it performed on different time segments.

Fold	MSE	RMSE	MAE
1	113.59	10.66	6.42
2	752.51	27.43	12.11
3	1489.95	38.60	25.13
<b>Average</b>	<b>785.35</b>	<b>25.56</b>	<b>14.55</b>

Table 4.5: Comparison of KF-LSTM performance for each fold

948        As can be seen in the table above, the performance of the hybrid model demon-  
 949        strated improvements in all metrics as compared to just using the Kalman Filter  
 950        alone.

## 951 4.5 Model Simulation

952 To evaluate the LSTM model's real-world forecasting ability, a simulation was  
953 conducted to predict dengue cases for the year 2025. The model was trained  
954 exclusively on data from 2011 to 2024, using both dengue cases and weather vari-  
955 ables. Importantly, the actual dengue case values for 2025 were never included  
956 during training. Instead, only the weather variables collected for 2025 were input  
957 into the model to generate predictions for that year. After prediction, the fore-  
958 casted dengue cases for 2025 were compared against the true observed cases to  
959 assess the model's accuracy. Figure 4.18 shows that the predicted values closely  
960 follow the trend, although it may overestimate the dengue cases in some weeks.

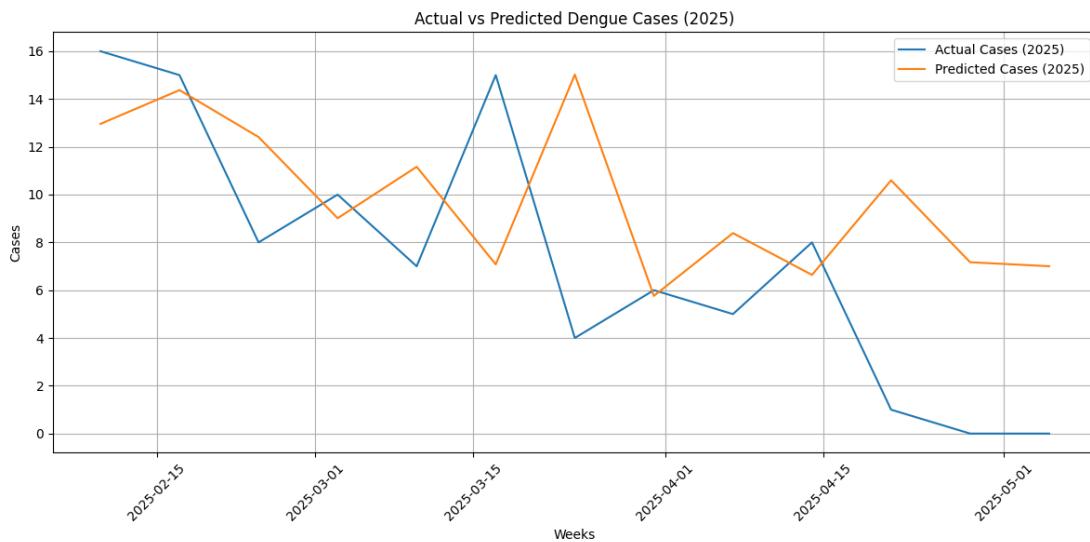

Figure 4.18: Predicted vs Actual Dengue Cases 2025

## 961 4.6 System Prototype

### 962 4.6.1 Home Page

963 The Home Page is intended for all visitors of the web application. The Analytics  
964 Dashboard, which displays relevant statistics for dengue cases at a certain year  
965 and location, is the primary component highlighted, as seen in Figure 4.19. This  
966 component includes a combo chart that graphs the number of dengue cases and  
967 deaths per week in a specific year, a choropleth map that tracks the number of

968 dengue cases per location, and various bar charts that indicate the top locations  
 969 affected by dengue.

Figure 4.19: Home Page

#### 970 4.6.2 User Registration, Login, and Authentication

971 The registration page, as shown in Figure 4.20, serves as a gateway to access the  
 972 authenticated pages of the web application. Only prospected encoders can create  
 973 an account since administrator accounts are only made by existing administrator  
 974 accounts to protect the data's integrity in production. After registering, the  
 975 "encoder account" cannot access the authorized pages yet as it needs to be veri-  
 976 fied first by an administrator managing the unit the user entered. Once verified,  
 977 the user can log in to the system through the page shown in Figure 4.21. Af-  
 978 ter entering the correct credentials, which consist of an email and password, the

979 system uses HTTP-only cookies containing JSON Web Tokens (JWT) to prevent  
980 vulnerability to Cross-site Scripting (XSS) attacks. It will then proceed to the  
981 appropriate page the type of user belongs to.

The screenshot shows the 'Sign Up' page of the DengueDash application. At the top, there is a blue header bar with the text 'DengueDash' on the left and 'Dashboard Login' on the right. Below the header, the page title 'Sign Up' is centered, with the sub-instruction 'Create your account to get started' underneath it. The form consists of several input fields: 'First Name' (John), 'Middle Name (Optional)' (David), 'Last Name' (Doe), 'Sex' (Select gender), 'Email' (john@example.com), 'Region' (Select region), 'Surveillance Unit' (Select surveillance unit), 'DRU' (Select DRU), 'Password' (a field with placeholder text 'Must be at least 8 characters long'), and 'Confirm Password'. At the bottom of the form is a large black button labeled 'Create Account'. Below this button, there is a link 'Already have an account? Sign in'.

Figure 4.20: Sign Up Page

The screenshot shows the 'Welcome back!' page of the DengueDash application. At the top, there is a blue header bar with the text 'DengueDash' on the left and 'Dashboard Login' on the right. The main content area has a white background with a central box titled 'Welcome back!'. Inside this box, there are two input fields: 'Email' (with placeholder text 'Enter your email') and 'Password' (with placeholder text 'Enter your password'). Below these fields are two small checkboxes: 'Remember me' and 'Forgot password?'. At the bottom of the box is a large green button labeled 'Continue'.

Figure 4.21: Login Page

### 982 4.6.3 Encoder Interface

#### 983 Case Report Form

984 Figures 4.22 and 4.23 show the digitized counterpart of the form obtained from the  
985 Iloilo Provincial Epidemiology and Surveillance Unit. As the system aims to sup-  
986 port expandability for future features, some fields were modified to accommodate  
987 more detailed input. It is worth noting that all of the included fields adhere to the  
988 latest Philippine Integrated Disease and Surveillance Response (PIDS) Dengue  
989 Forms, which the referenced form was based on. By doing this, if implemented  
990 on a national scale, the transition between targeted users will be easier. More-  
991 over, the case form includes the patient's basic information, dengue vaccination  
992 status, consultation details, laboratory results, and the outcome. On the other  
993 hand, encoders can also create case records using a "bulk upload" feature that  
994 makes use of a formatted CSV file template. As shown in Figure 4.24, an encoder  
995 can download the template using the "Download Template" button, and insert  
996 multiple records inside the file, then upload it by clicking the "Click to upload"  
997 button. The web application automatically checks the file for data inconsis-  
998 tencies and validation.

The screenshot shows the 'Case Report Form' page within the 'DengueDash' application. The left sidebar contains a navigation menu with 'Modules' (Analytics, Forms, Data Tables, Settings), a user profile (CN Elizabeth Thomas Ra...), and a footer note (© 2023 Example Company). The main content area has a breadcrumb trail: Building Your Application > Data Fetching. The 'Case Report Form' title is at the top, with a 'Bulk Upload' button. Below is a 'Personal Information' section with tabs for 'Personal Detail' and 'Clinical Status'. The 'Personal Detail' tab is active, showing fields for First Name, Middle Name, Last Name, Suffix, Sex (dropdown), Date of Birth (date picker), and Civil Status (dropdown). The 'Address' section follows, with Region, Province, City, Barangay, Street, and House No. fields. The 'Vaccination' section includes Date of First Vaccination and Date of Last Vaccination (date pickers). A 'Next' button is at the bottom right.

Figure 4.22: First Part of Case Report Form

The screenshot shows the second part of a 'Case Report Form' within the DengueDash application. The left sidebar contains a navigation menu with 'Case Report Form' selected. The main area has a header 'Case Report Form' and a 'Bulk Upload' button. It is divided into sections: 'Personal Information' (which is currently active, indicated by a blue underline) and 'Clinical Status'. The 'Clinical Status' section is further divided into 'Consultation' and 'Laboratory Results'.

**Consultation**

- Date Admitted/Consulted/Seen: Pick a date
- Is Admitted?: Select
- Date Onset of illness: Pick a date
- Clinical Classification: Select

**Laboratory Results**

Test	Status	Date done
NS1	Pending Result	Pick a date
IgG ELISA	Pending Result	Pick a date
IgM ELISA	Pending Result	Pick a date
PCR	Pending Result	Pick a date

**Outcome**

Case Classification	Outcome
Select	Select

Date of Death: Pick a date

Buttons at the bottom include 'Previous' and 'Submit'.

Figure 4.23: Second Part of Case Report Form

The screenshot shows the DengueDash application interface. On the left is a sidebar with 'Case Report Form' selected under 'Forms'. The main area is titled 'Case Report Form' and contains sections for 'Personal Information' and 'Clinical Status'. A 'Bulk Upload' button is visible in the top right. A modal window titled 'Bulk Upload Patient Cases' is open, prompting the user to 'Upload a CSV file to create multiple patient cases at once'. It includes a 'Click to upload' button, a note about CSV file size (max 5MB), and links for 'Need a template?' and 'Download Template'. Below the modal, there's a 'CSV Format Requirements' section with a bulleted list of guidelines. At the bottom of the modal are 'Reset' and 'Upload CSV' buttons. The background shows fields for 'First Name', 'Last Name', 'Sex', 'Date of Birth', 'Address', 'Region', 'City', and 'Street', each with dropdown or input fields. A watermark 'CN Elizabeth Thomas RA... zewita@example.com' is at the bottom left.

Figure 4.24: Bulk Upload of Cases using CSV

## 999 Browsing, Update, and Deletion of Records

1000 Once the data generated from the case report form or the bulk upload is vali-  
 1001 dated, it will be assigned as a new case and can be accessed through the Dengue  
 1002 Reports page, as shown in Figure 4.25. The said page displays basic information  
 1003 about the patient related to a specific case, including their name, address, date  
 1004 of consultation, and clinical and case classifications. It is also worth noting that  
 1005 it only shows cases the user is permitted to view. For example, in a local Disease  
 1006 Reporting Unit (DRU) setting, the user can only access records that belong to  
 1007 the same DRU. On the other hand, in a consolidated surveillance unit such as a  
 1008 regional, provincial, or city quarter, its users can view all the records from all the  
 1009 DRUs that report to them. Moving forward, Figure 4.26 shows the detailed case  
 1010 report of the patient on a particular consultation date.

**Dengue Reports**

Case ID	Name	Barangay	City	Date Consulted	Clinical Classification	Case Classification	Action
25017095	Hodges, Destiny Michelle	Pale Benedicto Rizal (Manduriao)	ILOILo CITY (Capitol)	2024-11-03	Severe dengue	Probable	<button>Open</button>
25017077	Cuevas, Robert Rebecca	Democracia	ILOILo CITY (Capitol)	2024-11-03	With warning signs	Confirmed	<button>Open</button>
25017090	Middleton, Joseph Michael	Tanza-Esperanza	ILOILo CITY (Capitol)	2024-11-01	With warning signs	Suspect	<button>Open</button>

CN Iloilo City Epidemiol... ilococeu@gmail.com

Figure 4.25: Dengue Reports

The screenshot shows the DengueDash application interface. On the left is a sidebar with a navigation menu:

- Modules
  - Accounts
  - DRU
  - Analytics
  - Data Tables
    - Dengue Reports
  - Settings

Below the sidebar, the user's information is displayed: CN Iloilo City Epidemiol... and Email iloiloepi@gmail.com.

The main content area is titled "Building Your Application > Data Fetching". It displays a "Personal Information" section for Michael Paige, showing details like Full Name (Medina, Michael Paige), Date of Birth (October 11, 1935), Sex (Male), and Civil Status (Widowed). It also shows his address: 995 Monique Spur, Tacas, ILOILO CITY (Capital), Iloilo.

Under "Vaccination Status", it shows First Dose (April 26, 2023) and Last Dose (May 31, 2020).

A "Case Record #25017089" section is shown, with "Update Case" and "Delete Case" buttons. It includes fields for Date of Consultation (November 1, 2024), Patient Admitted? (No), Date Onset of Illness (October 23, 2024), Clinical Classification (With warning signs), and Date Done (October 27, 2024).

The "Laboratory Results" section lists test results for NS1 (Negative, Date Done: October 27, 2024), IgG Elisa (Equivocal, Date Done: October 30, 2024), IgM Elisa (Pending Result, Date Done: N/A), and PCR (Pending Result, Date Done: N/A).

The "Outcome" section shows Case Classification (Probable) and Outcome (Dead).

The "Interviewer" section lists Interviewer (Daniels, Lisa Long) and DRU (Molo District Health Center).

Figure 4.26: Detailed Case Report

1011 To update the case, the user can click the "Update Case" button, where a  
 1012 dialog will appear, and the updateable fields will be shown. It is worth noting  
 1013 that in this case, only fields under Laboratory Results and Outcome are included  
 1014 since they are the only ones that are time-based, where the result may change in  
 1015 the future. After updating, a prompt will show confirming the action of the user.  
 1016 Moving forward, to delete a case record, the user must click the "Delete Case"  
 1017 button, and a prompt verifying the action will appear. After confirming, the case  
 1018 will be deleted permanently.

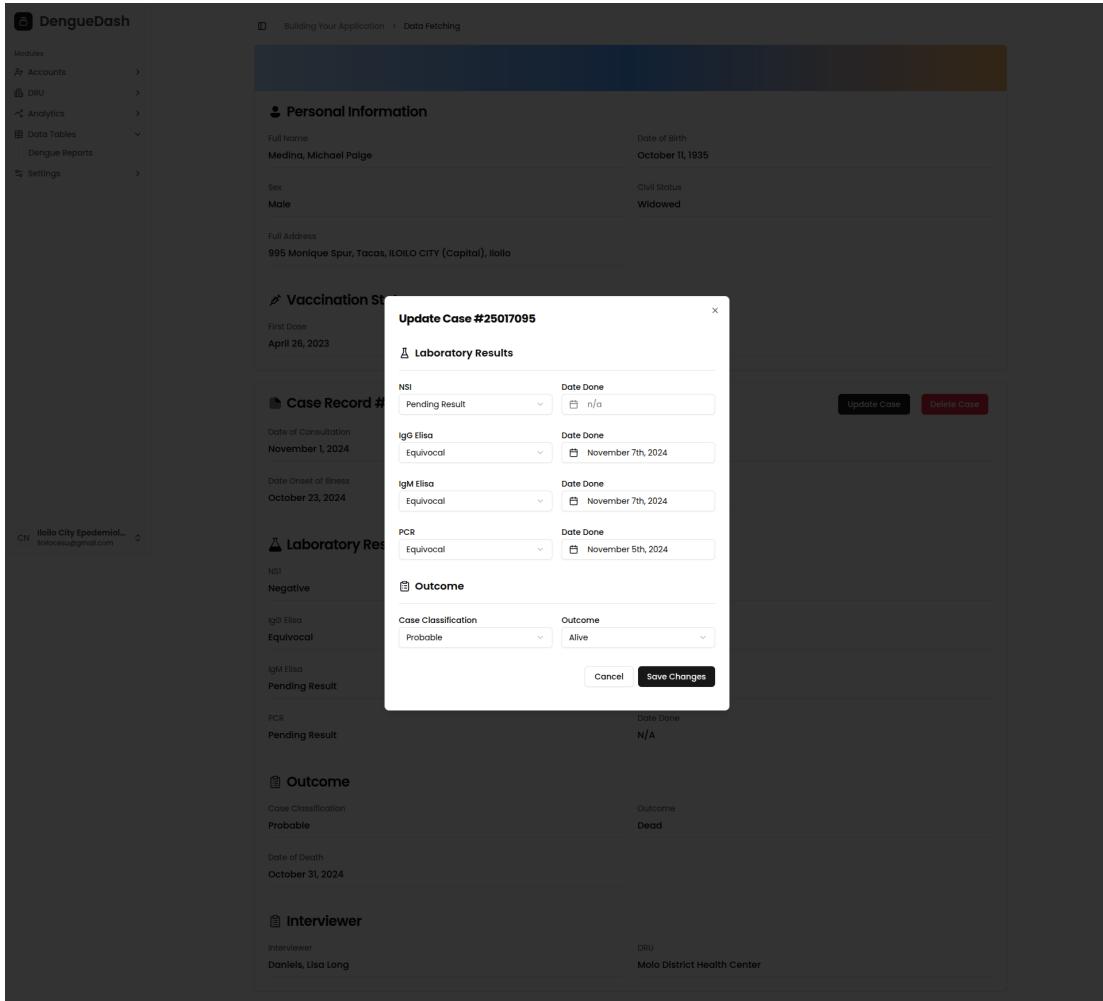

Figure 4.27: Update Report Dialog

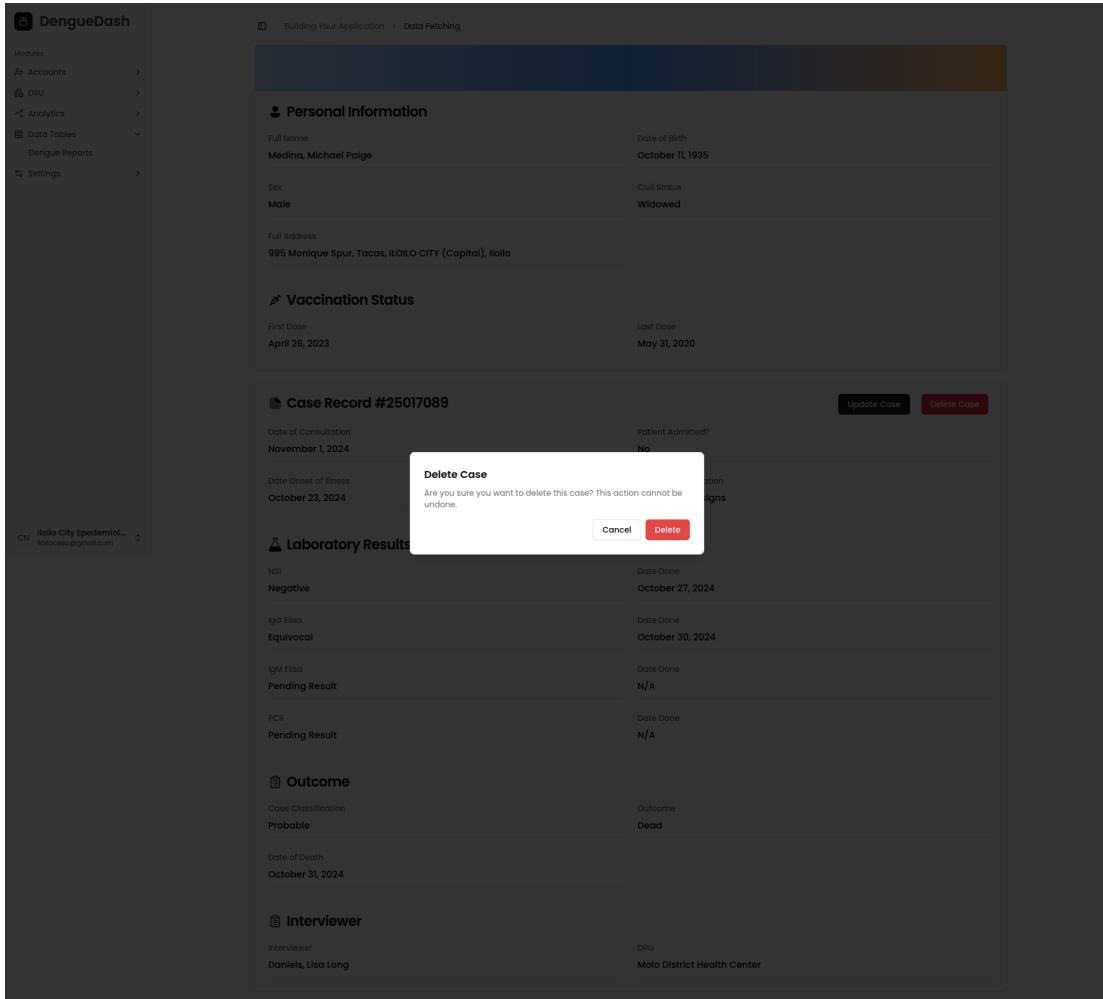

Figure 4.28: Delete Report Alert Dialog

## 1019    Forecasting

1020    The piece de resistance of the web application's feature is the Forecasting Page.  
 1021    This is where users can forecast dengue cases for the next following weeks. To  
 1022    predict, the application utilizes the exported LSTM model in a Keras format  
 1023    derived from training the consolidated data from the database. It requires the  
 1024    recent weekly dengue cases and weather variable data (temperature, humidity, and  
 1025    rainfall) based on the window size. This allows the web application to display a line  
 1026    chart with the anticipated number of dengue cases over the following four weeks.  
 1027    Moving forward, the Forecasting page, as shown in Figure 4.29, introduces a user-  
 1028    friendly interface that shows the current cases for the week and the predictions for  
 1029    the next two weeks with a range of 90 percent to 110 percent confidence interval

1030 that is presented in a simple but organized manner. There is also a line chart  
 1031 that shows the number of cases from the last 5 weeks plus the forecasted weekly  
 1032 cases. In addition, the current weather data for a specific week is also shown, as  
 1033 well as the forecasted weather data fetched from the OpenWeather API. Lastly,  
 1034 locations where dengue cases have been reported for the current week are listed  
 1035 in the Location Risk Assessment component.

Figure 4.29: Forecasting Page

## 1036 4.6.4 Admin Interface

### 1037 Retraining

1038 With LSTM being the best-performing model among the models used in forecast-  
1039 ing dengue cases, it is the model chosen to power the prediction and retraining  
1040 of the consolidated data within the web application. Since the retraining process  
1041 consumes a lot of processing power and requires a more advanced understanding  
1042 of how it works, it was decided that the said feature should only be available  
1043 to admin users. Furthermore, the retraining component in the Forecasting page  
1044 includes three additional components that include the configuration of LSTM pa-  
1045 rameters (Figure 4.30), the actual retraining of the consolidated data from the  
1046 database (Figure 4.31), and the results of the retraining that shows the current  
1047 and previous model metrics depending on the parameters entered (Figure 4.32).  
1048 It is also worth noting that when trained, the model used a seeded number to  
1049 promote reproducibility.

Figure 4.30: Retraining Configurations

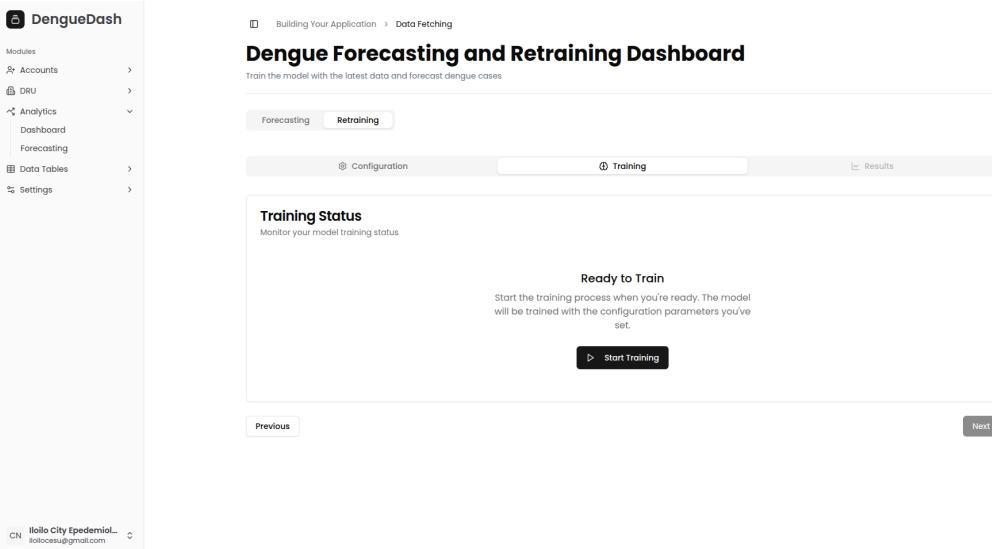

Figure 4.31: Start Retraining

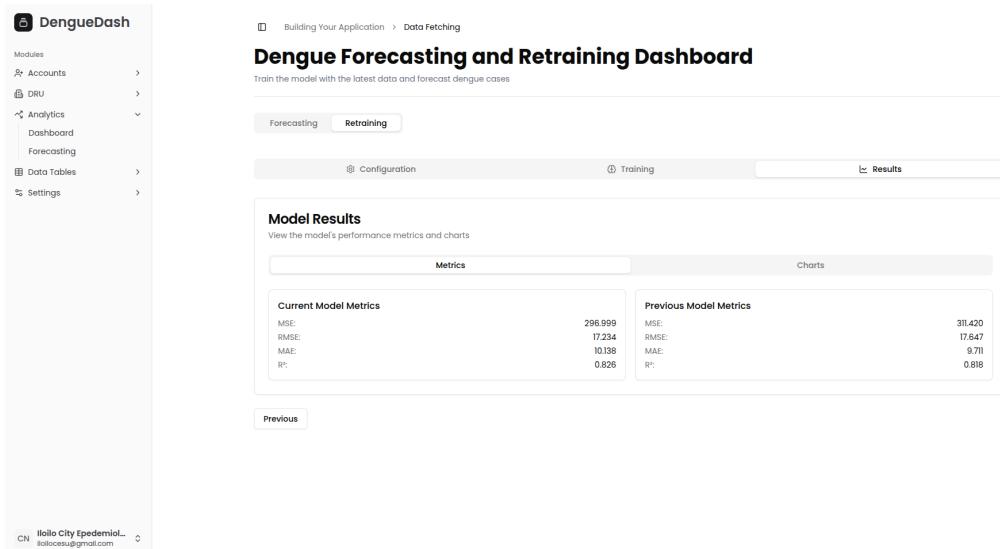

Figure 4.32: Retraining Results

## 1050 Managing Accounts

1051 Proper management of accounts is important to protect the integrity and confi-  
1052 dentiality of data. Thus, it is crucial for administrators to track their users and  
1053 control the flow of information. As discussed in the user registration of encoders,  
1054 admin users from a specific DRU or surveillance have the power to grant them ac-  
1055 cess to the web application. Figure 4.34 illustrates the interface for this scenario,  
1056 as the admins can approve or reject their applications. Once approved, these users  
1057 can access the features given to encoders and may be promoted to have admin-  
1058 istrative access, as shown in Figure 4.35. When deleting an account, the user's  
1059 email will be blacklisted and illegible to use when creating another account, and  
1060 all the cases reported by this user will be soft-deleted. The same figure also shows  
1061 the expanded details of the user, which include personal information and brief  
1062 activity details within the system.

The screenshot shows the DengueDash application interface. On the left is a sidebar with a navigation menu:

- Modules
  - Accounts (selected)
  - DRU
  - Analytics
  - Data Tables
  - Settings

The main content area is titled "Manage Accounts". At the top, there are three buttons: "Verified" (highlighted), "Pending", and "Blacklisted". Below this is a table with the following data:

Name	Email	Role	Sex	Actions
Cheryl Hernandez King	omarpatterson@example.net	Encoder	Female	<button>Open</button>

At the bottom left of the main area, there is a small user profile icon with the text "CN illo City Epidemiol..." and "illocessu@gmail.com".

Figure 4.33: List of Verified Accounts

Name	Email	Sex	Created At	Actions
John David Doe	testereee@example.gov.ph	Male	2025-04-26	<button>Approve</button> <button>Delete</button>

Figure 4.34: List of Pending Accounts

Name John David Doe	Email testereee@example.gov.ph
Sex Male	Role Encoder
Hospital (DRU) Saint Paul's Hospital	
Credited At April 26 2025 at 16:19:07	Updated At April 26 2025 at 16:21:16
Last Login N/A	

Figure 4.35: Account Details

## 1063 Managing DRUs

1064 Unlike the registration of encoder accounts, the creation of Disease Reporting  
 1065 Units can only be done within the web application, and the user performing the  
 1066 creation must be an administrator of a surveillance unit. Figure 4.36 presents the

1067 fields the admin user must fill out, and once completed, the new entry will show  
 1068 as being managed by that unit, as shown in Figure 4.37. Figure 4.38, on the other  
 1069 hand, shows the details provided in the registration form as well as its creation  
 1070 details. There is also an option to delete the DRU, and when invoked, all the  
 1071 accounts being managed by it, and the cases reported under those accounts will  
 1072 be soft-deleted.

The screenshot shows the DengueDash application interface. On the left, there is a sidebar with the following menu items:

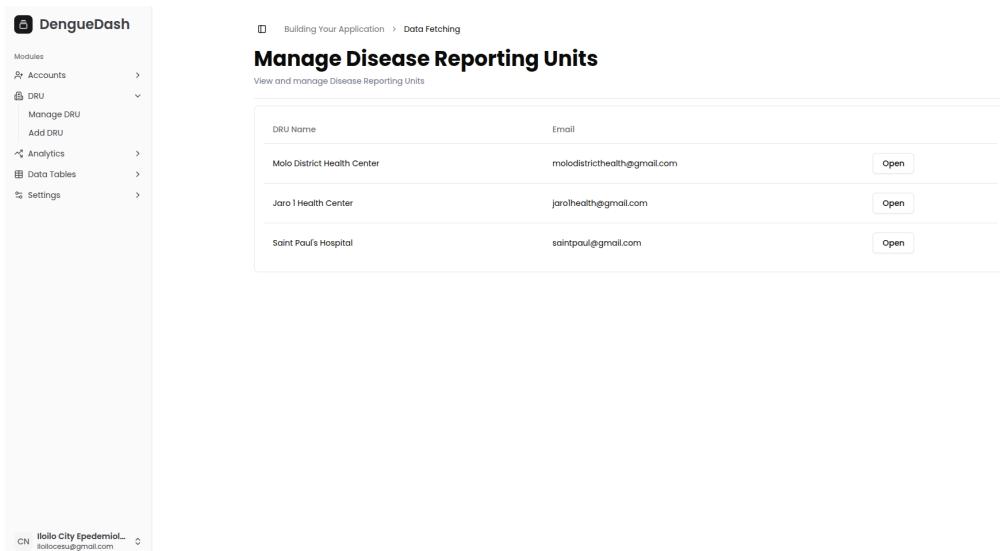

- Modules
- Accounts
- DRU
- Manage DRU
- Add DRU
- Analytics
- Data Tables
- Settings

The main content area is titled "Register Disease Reporting Unit". It contains the following fields:

- Name**: A text input field with placeholder text "Enter DRU name". Below it is a note: "The official name of the Disease Reporting Unit."
- Address Information**:
  - Region**: A dropdown menu labeled "Select Region".
  - Province**: A dropdown menu labeled "Select Province".
  - City/Municipality**: A dropdown menu labeled "Select City/Municipality".
  - Barangay**: A dropdown menu labeled "Select Barangay".
- Street Address**: A text input field with placeholder text "House/Building No., Street Name".
- Email**: A text input field with placeholder text "example@health.gov".
- Contact Number**: A text input field with placeholder text "+63 912 345 6789".
- DRU Type**: A dropdown menu labeled "Select DRU type". Below it is a note: "The category that best describes this reporting unit."

At the bottom right of the form is a large black button labeled "Register DRU".

Figure 4.36: DRU Registration

The screenshot shows the DengueDash application interface. On the left, there is a sidebar with the following menu items:

- Modules
- Accounts
- DRU
- Manage DRU
- Add DRU
- Analytics
- Data Tables
- Settings

The main content area is titled "Manage Disease Reporting Units". It displays a table of registered DRUs:

DRU Name	Email	Action
Molo District Health Center	molodistricthealth@gmail.com	<button>Open</button>
Jaro I Health Center	jarohealth@gmail.com	<button>Open</button>
Saint Paul's Hospital	saintpaul@gmail.com	<button>Open</button>

At the bottom right of the table is a small "Delete" icon.

Figure 4.37: List of DRUs

The screenshot shows the DengueDash application interface. On the left is a sidebar with 'DengueDash' logo and 'Modules' section containing 'Accounts', 'DRU', 'Analytics', 'Data Tables', and 'Settings'. The main content area has a breadcrumb navigation: 'Building Your Application > Data Fetching'. The title is 'Disease Reporting Unit Profile' with a subtitle 'View and manage DRU details'. The profile card for 'Molo District Health Center' contains the following fields:

- Name of DRU: Molo District Health Center
- Email: molodistrictthealth@gmail.com
- Address: M.H. Del Pilar Street, Molo, Molo, ILOILO CITY (Capital), ILOILO
- Contact Number: 09123456782
- Region: Region VI (Western Visayas)
- Surveillance Unit: Iloilo CESU
- DRU Type: CHO/MHO/PHO
- Created At: April 26 2025 at 13:07:00
- Updated At: April 26 2025 at 13:07:00

A red button at the bottom right of the card says 'Delete DRU'.

Figure 4.38: DRU details

## 1073 4.7 User Testing

1074 To evaluate the usability of the system, the System Usability Scale (SUS) was  
 1075 utilized. SUS is a Likert-scale-based questionnaire comprising 10 items that are  
 1076 critical to assessing system usability. A total of five participants completed the sur-  
 1077 vey. Their responses were processed following the step-by-step calculation method  
 1078 adopted from (Babich, 2015). The resulting usability scores for each participant  
 1079 are shown in Table 4.6.

Participant	Usability Score
1	95.0
2	90.0
3	85.0
4	87.5
5	85.0
<b>Average</b>	<b>88.5</b>

Table 4.6: Computed System Usability Scores per Participant

1080 The average System Usability Scale (SUS) score across systems is typically  
 1081 68 (Babich, 2015). In this testing, the system achieved an average SUS score  
 1082 of 88.5, indicating a highly positive user experience. This score suggests that  
 1083 participants found the system not only enjoyable to use but also intuitive enough

1084 to recommend to others. Furthermore, it demonstrates that the system is suitable  
1085 for real-world applications without presenting significant complexity for first-time  
1086 users.

1087 **Chapter 5**

1088 **Conclusion**

1089 **Revolutionizing Dengue Surveillance: The Rise of AI-Driven Forecasting**

1090 The development of DengueWatch marks a transformative leap forward in public health technology, providing Iloilo City with a centralized system to combat one of the most persistent mosquito-borne diseases. Previously, data was recorded manually on paper, making tracking and analysis slow and error-prone. DengueWatch digitizes this process, enabling faster, more accurate monitoring. More than an academic project, DengueWatch serves as a practical solution aimed at shifting the approach from reactive outbreak response to proactive prevention. By combining deep learning models with real-time climate data integration, the system achieves a level of accuracy and usability that makes it viable for real-world deployment.

1101 At the heart of DengueWatch is a Long Short-Term Memory (LSTM) neural network, which outperformed traditional forecasting models such as ARIMA and Kalman Filter. The LSTM model achieved a Root Mean Square Error (RMSE) of 16.90, compared to 39.00 and 38.40 for ARIMA and Kalman, respectively—demonstrating a substantial improvement in predictive capability. This advantage stems from the LSTM’s ability to capture long-term dependencies and model nonlinear relationships between environmental factors and disease patterns.

1102 The analysis also revealed that climate indicators, particularly rainfall and humidity, play a significant role in dengue outbreaks, typically leading to a surge in cases three to five weeks after anomalies are detected. By incorporating these lagged effects, DengueWatch achieved an explanatory power of 83% ( $R^2 = 0.83$ ), offering a game-changing advantage for early intervention and resource allocation.

1113        Usability testing further underscored DengueWatch's readiness for real-world  
1114 deployment. The system achieved an average System Usability Scale (SUS) score  
1115 of 88.5, significantly above the industry benchmark of 68. This indicates that  
1116 users found the system intuitive, efficient, and suitable for operational use in  
1117 public health contexts. Key features such as a user-friendly dashboard, a two-week  
1118 forecasting window aligned with mosquito life cycles, and automated outbreak  
1119 alerts ensure that the system supports timely, effective responses.

1120        Beyond its immediate application in Iloilo City, the framework behind Dengue-  
1121 Watch holds the potential for broader impact. With minor adaptations, it can  
1122 be scaled nationally through integration with Department of Health surveillance  
1123 systems.

1124        DengueWatch exemplifies how deep learning can bridge the gap between data  
1125 science and life-saving interventions. It empowers health workers to act preemp-  
1126 tively, policymakers to allocate resources strategically, and communities to en-  
1127 gage in early preventive measures. As climate change accelerates the spread of  
1128 vector-borne diseases, systems like DengueWatch will become indispensable in  
1129 safeguarding public health. This system not only demonstrates the power of AI  
1130 in epidemiological forecasting but also lays the foundation for a smarter, more  
1131 resilient approach to combating infectious diseases in the years ahead.

**System Usability Scale (SUS)**

This is a standard questionnaire that measures the overall usability of a system. Please select the answer that best expresses how you feel about each statement after using the system today.

	Strongly Disagree	Somewhat Disagree	Neutral	Somewhat Agree	Strongly Agree
1. I think I would like to use DengueWatch frequently to monitor and forecast dengue cases.	<input type="checkbox"/>				
2. I found DengueWatch unnecessarily complex when entering or analyzing data.	<input type="checkbox"/>				
3. I thought DengueWatch was easy to use, even for someone unfamiliar with AI forecasting tools.	<input type="checkbox"/>				
4. I think I would need the support of an IT or technical person to use all the features of DengueWatch.	<input type="checkbox"/>				
5. I found the visualizations (charts, maps, graphs) in DengueWatch to be well-integrated and informative.	<input type="checkbox"/>				
6. I thought there was too much inconsistency in how different parts of the DengueWatch system behaved.	<input type="checkbox"/>				
7. I believe most public health workers would learn to use DengueWatch very quickly.	<input type="checkbox"/>				
8. I found DengueWatch very cumbersome to use when entering weekly case reports or viewing forecasts.	<input type="checkbox"/>				
9. I felt confident in using DengueWatch to get the information I needed for decision-making.	<input type="checkbox"/>				
10. I needed to learn a lot of things before I could get going with DengueWatch.	<input type="checkbox"/>				

How likely are you to recommend this website to others? (please circle your answer)

Not at all likely 0    1    2    3    4    5    6    7    8    9    10 Extremely likely

Please provide important comments about the website:
